## **CERTIFICATION PAGE**

### Certification for Authorized Organizational Representative (or Equivalent) or Individual Applicant

By electronically signing and submitting this proposal, the Authorized Organizational Representative (AOR) or Individual Applicant is: (1) certifying that statements made herein are true and complete to the best of his/her knowledge; and (2) agreeing to accept the obligation to comply with NSF award terms and conditions if an award is made as a result of this application. Further, the applicant is hereby providing certifications regarding conflict of interest (when applicable), drug-free workplace, debarment and suspension, lobbying activities (see below), nondiscrimination, flood hazard insurance (when applicable), responsible conduct of research, organizational support, Federal tax obligations, unpaid Federal tax liability, and criminal convictions as set forth in the NSF Proposal & Award Policies & Procedures Guide, Part I: the Grant Proposal Guide (GPG). Willful provision of false information in this application and its supporting documents or in reports required under an ensuing award is a criminal offense (U.S. Code, Title 18, Section 1001).

#### Certification Regarding Conflict of Interest

The AOR is required to complete certifications stating that the organization has implemented and is enforcing a written policy on conflicts of interest (COI), consistent with the provisions of AAG Chapter IV.A.; that, to the best of his/her knowledge, all financial disclosures required by the conflict of interest policy were made; and that conflicts of interest, if any, were, or prior to the organization's expenditure of any funds under the award, will be, satisfactorily managed, reduced or eliminated in accordance with the organization's conflict of interest policy. Conflicts that cannot be satisfactorily managed, reduced or eliminated and research that proceeds without the imposition of conditions or restrictions when a conflict of interest exists, must be disclosed to NSF via use of the Notifications and Requests Module in FastLane.

#### Drug Free Work Place Certification

By electronically signing the Certification Pages, the Authorized Organizational Representative (or equivalent), is providing the Drug Free Work Place Certification contained in Exhibit II-3 of the Grant Proposal Guide.

#### Debarment and Suspension Certification (If answer "yes", please provide explanation.)

Is the organization or its principals presently debarred, suspended, proposed for debarment, declared ineligible, or voluntarily excluded from covered transactions by any Federal department or agency?

By electronically signing the Certification Pages, the Authorized Organizational Representative (or equivalent) or Individual Applicant is providing the Debarment and Suspension Certification contained in Exhibit II-4 of the Grant Proposal Guide.

### Certification Regarding Lobbying

This certification is required for an award of a Federal contract, grant, or cooperative agreement exceeding \$100,000 and for an award of a Federal loan or a commitment providing for the United States to insure or guarantee a loan exceeding \$150,000.

### Certification for Contracts, Grants, Loans and Cooperative Agreements

The undersigned certifies, to the best of his or her knowledge and belief, that:

(1) No Federal appropriated funds have been paid or will be paid, by or on behalf of the undersigned, to any person for influencing or attempting to influence an officer or employee of any agency, a Member of Congress, an officer or employee of Congress, or an employee of a Member of Congress in connection with the awarding of any Federal contract, the making of any Federal grant, the making of any Federal loan, the entering into of any cooperative agreement, and the extension, continuation, renewal, amendment, or modification of any Federal contract, grant, loan, or cooperative agreement.

(2) If any funds other than Federal appropriated funds have been paid or will be paid to any person for influencing or attempting to influence an officer or employee of any agency, a Member of Congress, an officer or employee of Congress, or an employee of a Member of Congress in connection with this Federal contract, grant, loan, or cooperative agreement, the undersigned shall complete and submit Standard Form-LLL, "Disclosure of Lobbying Activities," in accordance with its instructions.

(3) The undersigned shall require that the language of this certification be included in the award documents for all subawards at all tiers including subcontracts, subgrants, and contracts under grants, loans, and cooperative agreements and that all subrecipients shall certify and disclose accordingly.

This certification is a material representation of fact upon which reliance was placed when this transaction was made or entered into. Submission of this certification is a prerequisite for making or entering into this transaction imposed by section 1352, Title 31, U.S. Code. Any person who fails to file the required certification shall be subject to a civil penalty of not less than \$10,000 and not more than \$100,000 for each such failure.

#### Certification Regarding Nondiscrimination

By electronically signing the Certification Pages, the Authorized Organizational Representative (or equivalent) is providing the Certification Regarding Nondiscrimination contained in Exhibit II-6 of the Grant Proposal Guide.

#### Certification Regarding Flood Hazard Insurance

Two sections of the National Flood Insurance Act of 1968 (42 USC §4012a and §4106) bar Federal agencies from giving financial assistance for acquisition or construction purposes in any area identified by the Federal Emergency Management Agency (FEMA) as having special flood hazards unless the:

- (1) community in which that area is located participates in the national flood insurance program; and
- (2) building (and any related equipment) is covered by adequate flood insurance.

By electronically signing the Certification Pages, the Authorized Organizational Representative (or equivalent) or Individual Applicant located in FEMA-designated special flood hazard areas is certifying that adequate flood insurance has been or will be obtained in the following situations:

- (1) for NSF grants for the construction of a building or facility, regardless of the dollar amount of the grant; and
- (2) for other NSF grants when more than \$25,000 has been budgeted in the proposal for repair, alteration or improvement (construction) of a building or facility.

### Certification Regarding Responsible Conduct of Research (RCR)

### (This certification is not applicable to proposals for conferences, symposia, and workshops.)

By electronically signing the Certification Pages, the Authorized Organizational Representative is certifying that, in accordance with the NSF Proposal & Award Policies & Procedures Guide, Part II, Award & Administration Guide (AAG) Chapter IV.B., the institution has a plan in place to provide appropriate training and oversight in the responsible and ethical conduct of research to undergraduates, graduate students and postdoctoral researchers who will be supported by NSF to conduct research. The AOR shall require that the language of this certification be included in any award documents for all subawards at all tiers.

No 🛛

## **CERTIFICATION PAGE - CONTINUED**

### **Certification Regarding Organizational Support**

By electronically signing the Certification Pages, the Authorized Organizational Representative (or equivalent) is certifying that there is organizational support for the proposal as required by Section 526 of the America COMPETES Reauthorization Act of 2010. This support extends to the portion of the proposal developed to satisfy the Broader Impacts Review Criterion as well as the Intellectual Merit Review Criterion, and any additional review criteria specified in the solicitation. Organizational support will be made available, as described in the proposal, in order to address the broader impacts and intellectual merit activities to be undertaken.

#### **Certification Regarding Federal Tax Obligations**

When the proposal exceeds \$5,000,000, the Authorized Organizational Representative (or equivalent) is required to complete the following certification regarding Federal tax obligations. By electronically signing the Certification pages, the Authorized Organizational Representative is certifying that, to the best of their knowledge and belief, the proposing organization: (1) has filed all Federal tax returns required during the three years preceding this certification;

(2) has not been convicted of a criminal offense under the Internal Revenue Code of 1986; and

(3) has not, more than 90 days prior to this certification, been notified of any unpaid Federal tax assessment for which the liability remains unsatisfied, unless the assessment is the subject of an installment agreement or offer in compromise that has been approved by the Internal Revenue Service and is not in default, or the assessment is the subject of a non-frivolous administrative or judicial proceeding.

#### Certification Regarding Unpaid Federal Tax Liability

When the proposing organization is a corporation, the Authorized Organizational Representative (or equivalent) is required to complete the following certification regarding Federal Tax Liability:

By electronically signing the Certification Pages, the Authorized Organizational Representative (or equivalent) is certifying that the corporation has no unpaid Federal tax liability that has been assessed, for which all judicial and administrative remedies have been exhausted or lapsed, and that is not being paid in a timely manner pursuant to an agreement with the authority responsible for collecting the tax liability.

#### **Certification Regarding Criminal Convictions**

When the proposing organization is a corporation, the Authorized Organizational Representative (or equivalent) is required to complete the following certification regarding Criminal Convictions:

By electronically signing the Certification Pages, the Authorized Organizational Representative (or equivalent) is certifying that the corporation has not been convicted of a felony criminal violation under any Federal law within the 24 months preceding the date on which the certification is signed.

### **Certification Dual Use Research of Concern**

By electronically signing the certification pages, the Authorized Organizational Representative is certifying that the organization will be or is in compliance with all aspects of the United States Government Policy for Institutional Oversight of Life Sciences Dual Use Research of Concern.

## **Overview:**

Data curation is a critical task in data science in which raw data is structured, validated, and repaired. Traditionally, curation has been carried out as a pre-processing task: after all data are selected for a study (or application), they are cleaned before an analysis can begin. This is problematic because while some cleaning constraints can be easily defined. others are only discovered as one analyzes the data. In this project, we propose to build Vizier, a system that unifies curation and data exploration through provenance. Vizier integrates and extends three existing systems that we have developed in previous work: Mimir, a system that supports probabilistic pay-as-you-go data curation operators; VisTrails, an NSF-supported open-source system designed for interactive data exploration; and GProM, a database middleware that efficiently supports fine-grained provenance. Vizier's interface combines elements of both notebooks and spreadsheets, allowing users to quickly apply precise data repairs that can later be generalized and deployed over a large scale dataset. Vizier also allows developers to defer resolving ambiguous data until they have had a chance to thoroughly explore the ambiguity and its implications. The system uses non-intrusive visual cues to explain how and why it arrived at specific results. Vizier guides the user in incrementally building and refining a curation workflow by providing recommendations on which cleaning operations to apply and how to tune them.

### --- Project Participants ---

The proposed work will be supervised by Dr. Oliver Kennedy at the University at Buffalo, SUNY; Dr. Boris Glavic at the Illinois Institute of Technology; and Dr. Juliana Freire at New York University, with assistance from Dr. Heiko Mueller at New York University. As per his letter of collaboration, Dieter Gawlick and Zhen Hua-Liu of Oracle will provide guidance and feedback. As per their respective letters, we will receive assistance in designing and evaluating Vizier from Julia Lane and Rebecca Rosen of the NYU Center for Urban Science and Progress (CUSP), Ingrid Gould Ellen from NYU's Furman Center, Rodney Stiles from the NYC Taxi and Limousine Commission (TLC), and Ronny Fehling from the Airbus group.

--- Keywords ---

Provenance, Curation, Ambiguity, Urban Data, Sensor Data, Wrangling

--- Targetted NSF Directorates/Divisions ---

## CISE/IIS, SBS/SBE

### Intellectual Merit :

The proposed work links research efforts on three systems: Mimir, VisTrails, and GProM. An expected outcome of the work will be a better understanding of provenance, particularly in the context of data curation. The project will also contribute to the state of the art in data curation, from the design of data curation languages, to interface design, and exploratory data processing. Besides advancing the state of the art in data curation, the proposed work will also improve research in other fields, notably, in social sciences. It will also contribute to an emerging field: urban science. Through the deployment of our tools within CUSP and the Furman Center, our work has the potential to impact a wide range of scientists and students, as well as the NYC agencies that are partnering with CUSP and Furman on various projects.

### Broader Impacts :

Data quality is a serious problem that impacts data scientists in all fields of study. As demonstrated by active interest from our collaborators at Oracle, Airbus, CUSP, TLC, and the Furman Center, this project will have significant positive impact on government, industry, and academic research. We have participants already eager to use the tools we will develop, so the impactfulness of this project hinges not on where it can be deployed, but rather on how soon can it be ready. Our work will positively impact government by improving data quality, which in turn will lead to better planning and policies and more efficient operations. The ability to publish provenance-rich, high-quality data will also positively impact governance and citizen engagement. In addition to improving the state of the art in data curation, the project will also result in support for four PhD students and one Postdoctoral researcher.

**Curation as an Integral Component of Data Exploration** Data curation is a critical task in data science in which raw data is structured, validated, and repaired. Data validation and repair establish trust in analytical results, while appropriate structuring streamlines analytics. Unfortunately, even with advances in automated data cleaning tools, such as Oracle's Data Guide and Trifacta's Wrangler, curation is still a major bottleneck in data exploration. Traditionally, curation has been carried out as a pre-processing task: after all data are selected for a study (or application), they are cleaned and loaded into a database or data warehouse. This is problematic because while some cleaning constraints can be easily defined (e.g., checking for valid attribute ranges), others are only discovered as one analyzes the

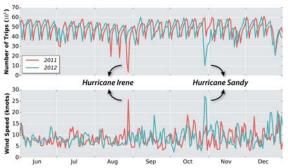

Figure 1: The plot on the top shows how the number of trips varies over 2011 and 2012. While the variation is similar for the two years, there are clear outliers, including large drops in August 2011 and in October 2012. These are not errors, but in fact correspond to hurricanes Sandy and Irene, as shown by the wind speed plot on the bottom.

data. As one example, consider taxis in New York City [218]. Every day, there are over 500,000 taxi trips transporting about 600,000 people from Manhattan to different parts of the city [36]. Through the meters installed in each vehicle, the Taxi & Limousine Commission (TLC) captures detailed information about trips, including: GPS readings for pick-up and drop-off locations, pick-up and drop-off times, fare, and tip amount. These data have been used in several projects to understand different aspects of the city, from creating mobility models and analyzing the benefits and drawbacks of ride sharing, to detecting gentrification. In a recent study [89], we investigated quality issues in the taxi data. We found invalid values such as negative mile and fare values, as well as trips that started or ended in rivers or outside of the US. These are clearly errors in the data. Other issues are more nuanced. An example is a fare with a tip of US\$938.02 (the maximum tip value for the 2010 dataset). While this could have be an error in the data acquisition or in the credit card information, it could also be the case that a wealthy passenger overtipped her taxi driver. Issues are often detected during analytics, as different slices of the data are aggregated. Figure 1 shows the number of daily taxi trips in New York City (NYC) during 2011 and 2012. Note the large drops in the number of trips in August 2011 and October 2012. Standard cleaning techniques are likely to classify these drastic reductions as outliers that represent corrupted or incorrect data. However, by integrating the taxi trips with wind speed data (bottom plot in Figure 1), we discover that the drops occur on days with abnormally high wind speeds, suggesting a causal relation: the effect of extreme weather on the number of taxi trips in NYC. Removing such outliers would hide an important phenomenon. Conversely, detecting it upfront requires identifying a non-obvious pattern in a very high-dimensional space [69].

Issues like these appear across all forms of analytics, making curation an integral component of data exploration. When erroneous features are identified, appropriate *cleaning operations should be applied on* the fly. Besides the need to refine a curation pipeline as the user gets more familiar with a dataset, different questions that arise during exploration may require different cleaning strategies. Thus, we need to move from the traditional cleaning function  $DirtyData \rightarrow CleanData$ , to a function that encapsulates the exploratory curation process:  $DirtyData \times UserTask \rightarrow (CleanData, Explanation)$ . The trial-and-error nature of the curation process poses several challenges. First, and foremost, the cleaned data must be accompanied by its provenance which explains the transformations applied to the raw data, as well as ambiguities that arise while applying these transformations. This is critical for subsequent analyses, as experts need to both assess the quality of the data and understand which assumptions they can rely on. If an operation is applied and later found to be incorrect (e.g., removing the outliers in Figure 1), it should be possible to *undo the operation and all of its direct and indirect effects.* It should also be possible to *modify an operation* (e.g., change the

parameters of an outlier detection operation to not consider the \$938.02 tip amount as an outlier) and the effects of this modification should be propagated to derived data. Furthermore, it is often necessary to *explore* and compare alternative cleaning strategies and to consolidate their results, especially when data curation is a collaborative effort. Currently, such corrections and refinements require an error-prone, time-consuming process to track different versions of scripts and queries used, and the data feeds they were applied to.

Building Infrastructure for Data Curation In this project, we propose to build Vizier, a system that unifies curation and data exploration through provenance. Vizier tracks the provenance of the exploratory process and all the computations performed [93, 98, 159, 224] as well as the provenance of the affected data items [215]. By connecting these two forms of provenance, Vizier is able to provide a detailed audit trail that explains which operations caused which changes to the data and to reproduce these steps on new data. Vizier will integrate and extend three production/near-production quality systems that we have developed in previous work: *Mimir* [143, 167, 231, 232], a system that supports probabilistic pay-as-you-go data curation operators; *VisTrails* [42, 43, 51, 99, 101, 128, 151, 200, 202, 209], an NSF-supported open-source system designed for interactive data exploration; and *GProM* [10, 11, 106, 107, 109, 116, 175], a database middleware that efficiently tracks fine-grained data provenance, even through update operations. A core challenge of implementing Vizier will be to integrate the data and provenance models of these systems and to develop a unified interface that synergystically combines the features of each.

To define the requirements for the system design, we have taken into consideration the curation needs of previous and ongoing projects led by the PIs in different domains—from urban to industrial data, as well as the results of a survey (see Section 1). Curation is a difficult task for experts in data management and computer science, and even more so for the growing number of *data enthusiasts*, with expertise in particular domains but that often lack training in computing. Furthermore, the process demands the iterative, trialand-error application and tuning of data cleaning operations. To support these requirements, Vizier will provide a novel "sandbox" interface for exploration and curation that is easy to use, and whose unique features are enabled by the integration of fine- and coarse-grained provenance.

Vizier's interface is a hybrid of notebook-style interfaces and spreadsheets. Notebook interfaces, as exemplified in Jupyter (http://jupyter.org), interleave code, data, summaries, visualizations, and documentation into a single train of thought that allows readers to retrace an analyst's exploratory process. Conversely, spreadsheets allow analysts an unprecedented level of flexibility and freedom, while still supporting a powerful programming model. Thus, in contrast to classical notebook software where all data manipulations must be handled programmatically, Vizier allows data, summaries, and visualizations to be edited directly as in a spreadsheet *and* in a classical programming environment *simultaneously*.

Vizier uses provenance to aid the user in the exploration process by enabling her to navigate the evolution of her curation pipeline, to understand the impact of cleaning operations she devises, and to understand sources and effects of uncertainty or ambiguity in her data. Vizier also uses provenance to provide recommendations to the user on how to tune curation operations, which curation operations to apply next [152], and how to generalize her curation workflow developed over a small sample dataset to deploy it over a large scale dataset (e.g., to deploy the workflow on a Big Data platform).

Finally, provenance enables the use of ambiguity-aware data transformations, including automated zeroconfiguration curation operators called lenses [167, 232]. Unlike classical clean-before-use approaches to data curation, Vizier allows data wranglers to defer resolving ambiguities. Ambiguities persist through transformations and appear as annotations (e.g., asterisks) on data in Vizier that indicate the cause and quantify the effects of the ambiguity. By deferring ambiguity resolution until after the user has had a chance to explore, the analyst can better decide how to resolve the ambiguity, or even whether she needs to resolve the ambiguity at all. Lenses also form the basis for Vizier's extensibility, as they allow data cleaning heuristics or tools to be just "plugged" in, even if the tools have overlapping use cases or conflicting effects.

The interface features of Vizier are enabled by tracking *provenance*. Edits, whether to code or data, are all *transparently* recorded and associated with the resulting data. Guesses made by the system on behalf of the user are recorded similarly. Provenance persists through computations and modifications, providing an audit trail and allowing the system to explain the reasoning behind results it shows to the analyst. Provenance allows potentially suspicious or ambiguous results to be flagged as such, provides context for results, and

by using well-established techniques for probabilistic and uncertain data management [214], also quantifies the impact of the ambiguity on the result. An important technical challenge we will tackle in this regard is how to integrate the workflow (evolution) provenance of VisTrails with the fine-grained data provenance of GProM and the ambiguity tracking of Mimir.

Interactive exploration also requires interactive latencies, even for large datasets. We will build Vizier to provide interactive response times through two techniques. First, through its facilities for tracking provenance, Vizier can enact a form of program slicing, a more general form of incremental view maintenance that allows data representations produced by Vizier to be updated rapidly in response to small changes to input data and parameters of curation workflows. Second, similar to Trifacta's Wrangler, Vizier allows analysts to extract and use samples of large datasets for preliminary development efforts. Unlike Wrangler, however, Vizier can measure the quality or representativeness of a sample set with respect to a given summary, representation, or view of the data. Furthermore, Vizier guides the user in tweaking a curation workflow developed over a sample dataset to ensure that it generalizes to the complete data.

**Community Building.** Users in a broad range of application domains from urban sciences to business intelligence, have committed to collaborate with the PIs on this proposal (see Section 1 and letters of collaboration). This diversity of collaborators will ensure that Vizier is relevant to real-world needs and help to establish a healthy user base. The latter is particularly important to sustain development beyond the initial funding period. Our strategy for building a healthy community around Vizier includes demonstrations, workshops, publicly released code, and ensuring proper documentation for users and development, and development of project governance. Our sustainability plan is detailed in Section 4.

The Team. The PIs bring cross-cutting expertise from different areas of research on data management, provenance, and visualization. Systems developed by each of the PIs: Mimir, GProM and VisTrails, will serve as the core building blocks of our proposed system Vizier. Additionally, PIs Kennedy and Glavic already have a record of collaboration that has resulted in joint papers (under submission) related to data curation, uncertainty, and provenance. Both PIs have ongoing projects in this domain that are sponsored by Oracle (see letter of collaboration from Gawlick and Hua-Liu). PI Kennedy's expertise covers optimization and incremental computation [3, 138, 145], data structures [144], uncertain data management [140–143, 167, 168, 232], online aggregation [137, 141], and mobile systems [49, 139]. He is a member of UB's Center for Multisource Information Fusion and National Center for Geographic Information Awareness, and has collaborations [49,139] based on UB's NSF-funded PhoneLab smartphone experimental platform. PI Glavic's research is focused on database systems with a strong track record in provenance [9, 11, 105–117, 174, 175, 182,183] and data integration [12–15,109,110]. He has designed and implemented several provenance-aware systems including Perm [106–108, 116], GProM [9, 11, 174, 175], Vagabond [109, 110], Ariadne [111, 112], and LDV [114, 182, 183]. PI Freire's research has focused on big-data analysis and visualization, large-scale information integration, provenance management, and computational reproducibility. She has a track record of successful interdisciplinary collaborations and her work has had impact in a number of domains beyond computer science, from physics and biology to climate research and social sciences [18, 29, 83, 125, 127, 194, 195,199]. She has co-authored multiple open-source systems [1,34,189,216,221,224] (see https://github. com/ViDA-NYU), including VisTrails which is used by high-visibility scientific applications in diverse fields. As the Executive Director of the Moore-Sloan Data Science Environment at NYU, a faculty member at the NYU Center for Data Science and at the NYU Center for Urban Science and Progress, she currently leads several projects where data curation is a key challenge.

## 1 Applications and Requirement Gathering

The need for data curation arises in all applications of data science. To ensure that our efforts will see use in practice, the PIs will deploy Vizier through established collaborative efforts with data scientists in academia and industry. These collaborations will serve as a platform to evaluate Vizier, as well as a source of feedback, helping us to identify and address critical pain points in data curation workflows. Additionally, we have conducted an informal survey, reaching out to several affiliated data science communities and potential consumers of Vizier for feedback and desiderata. In this section, we outline our two primary collaborative efforts, as well as the high-level feedback garnered from our informal survey.

### 1.1 Curating Urban Data

The NYU team is working on several projects that involve curation, analysis and integration of urban data [28, 33, 47, 70, 71, 84, 102, 125, 180, 181, 184, 216]. PI Freire is a faculty member at the NYU Center for Urban Science and Progress (CUSP). CUSP is set up as a unique public-private research center that uses New York City as its laboratory and classroom to help cities around the world become more productive, livable, equitable, and resilient. Research and development at CUSP focuses on the collection, integration, and analysis of data to improve urban systems. The social sciences play an integral role in CUSP activitiespeople are the customers and operators of urban systems, so that understanding them and their behavior is essential to the CUSP mission. Conversely, CUSPs large, multi-modal data sets and technology have the potential to revolutionize the social sciences. CUSP has established a data facility (CDF) to support the empirical study of cities. Freire was one of the original designers of CDF and part of the vision of this proposal was motivated by the needs of CDF users, notably: different users (and projects) need to combine and clean datasets in different ways, depending on their research questions, which change over time as the process evolves and new hypotheses are formulated; users come from widely different backgrounds, and include social scientists, physicists, computer scientists, civil engineers, policy makers, and students. As Professor Lane and Dr. Rosen state in their letter of collaboration, the CDF needs a data curation infrastructure such as the one we propose to build. Vizier will bring many benefits to CDF, including: users will be to able collaboratively curate data; curated data will include detailed provenance, allowing them to be re-used; and curation pipelines will also be shared within the facility, enabling users to benefit from the collective wisdom of their peers by re-using and building upon these pipelines.

Freire also has an ongoing collaboration with the NYU Furman Center for Real Estate and Policy [125]. The Furman Center uses urban data to explore the effect that land use regulations, real estate development, and other public and private place-based investments have on the quality, affordability, and character of neighborhoods and on individual well-being (see e.g., [76, 77, 126, 205]). They take an interdisciplinary approach, applying policy and legal analyses, as well as econometric techniques to study critical current issues. Over the years, they have collected a broad array of data on demographics, neighborhood conditions, infrastructure, housing stock and other aspects of New York City's neighborhoods and real estate market [103]. They also produce a series of data products that help inform community groups, developers, policymakers and investors about trends, challenges and opportunities in particular neighborhoods [31, 32, 45, 46]. Given that their research has direct impact on policies and the data they release is widely used, for them, data quality is of utmost importance (see letter from Professor Gould Ellen).

Freire's group has multiple ongoing collaborations with NYC agencies. She is a member of the NYC Taxi & Limousine Commission (TLC) Data/Technology Advisory Committee. She has collaborated with the TLC on different projects, from the study of privacy and quality issues in data they release [89] to the deployment of TaxiVis, an open-source tool for the analysis of spatio-temporal data [84, 102, 216]. As with many other agencies that use data to improve their operations and policies, and that publicly release these data [179], the TLC faces tremendous challenges around data quality (see letter by Rodney Styles, TLC).

Our collaborators will provide us unique data and feedback that we will use in the design of Vizier, and we will collaborate with them on the deployment of the system at CUSP, Furman Center, and TLC.

### **1.2** Industrial Strength Data Lakes

Our second effort is part of a large, ongoing collaborative project between PIs Kennedy and Glavic and Oracle's Dieter Gawlick and Zhen Hua-Liu, as well as with Ronny Fehling, Head of Data Driven Technologies and Advanced Analytics at Airbus (see attached letters). One specific part of this effort concerns a large scale project at Airbus to merge data sources from different sectors of its business into a single, company-wide data lake. In addition to the issues of data quality that arise in our collaboration with CUSP, an operation of this scale presents several additional challenges:

**Cross-Domain Data Mapping.** Datasets from different sectors have distinct, non-overlapping schemas, as well as distinct attribute domains recorded at different granularities. There are also more subtle conflicts. For example, one assumption often made when using a dataset is temporal stability [143]. An anecdotal example encountered during past collaborative efforts involved an auto-generated report that computed revenue totals for sales groups at a large company. Revenue totals would fluctuate unexpectedly over time,

even decreasing for some groups. The cause was mismatched temporal assumptions between an append-only sales history dataset and a HR database linking salespeople to their groups. As salespeople moved between groups, the HR database was updated and past sales would be re-attributed to their new group.

**Data Discovery.** Given the number of distinct data sources and data sets available at a company of this scale, simply finding datasets applicable to a specific problem is a challenge. Forcing participants in the data lake to properly create and curate metadata for their datasets is infeasible, necessitating alternative approaches to data discovery.

**Heterogeneity.** The data lake draws on a heterogeneous mix of storage layers and data sources including Hadoop, client APIs, external tables, and live data feeds, a fact that makes other data quality challenges more difficult. Cross domain data mapping is more difficult, as schemas and attribute domains may not be immediately accessible. Data discovery also becomes more difficult, as complete datasets are not available and associated metadata must either be tracked independently or through purpose-built adaptors.

**Versioning.** As analysts progressively refine and extend a dataset, multiple revisions of the same data become available. Using an earlier revision may require an analyst to duplicate effort, while a later revision may be modified in unexpected ways that are inconsistent with the analyst's current goals.

#### **1.3** Community Feedback

As a preliminary effort at reaching a broader audience, we have conducted an informal survey to gauge preliminary interest in Vizier, as well as to solicit feedback from different communities about the data curation challenges that they face. The survey was distributed directly to many of the PI's colleagues and collaborators at potential deployment sites like UB's National Center for Geographic Information and Analysis. Over the course of a one-week informal survey period, we received 8 detailed responses from parties expressing interest in improved tools for data cleaning and a further 3 additional off-the-record responses expressing frustration with the state of the art in data curation. The preliminary responses indicate that spreadsheets are the tool of choice for data curation (used by 6 out of the 8 respondents). The two respondents who do not use spreadsheets, regularly work with data at sizes to which spreadsheets do not scale. When asked informally, one of these respondents stated that a spreadsheet-style interface used to design scalable curation workflows over samples would be useful to them. When asked about the biggest challenges in their most recent analytics task, the two most common answers were: the time taken to perform computations and data quality. For the first case, standard database techniques (indexing, incremental maintenance, set-at-a-time) are often sufficient, but require too much effort to deploy, configure, and load data into. A concern with missing or garbage data was also common, and several respondents in particular noted issues of data quality when working with different schema versions simultaneously.

Throughout our project, we will continue to seek feedback from experts in different domains. This will not only ensure the proposed infrastructure will be widely available, but we also hope this will help create and sustain a strong user community for Vizier.

### 2 The Vizier System

The goal of Vizier is to **unify the tasks of data exploration and data curation** under a single interface (illustrated in Figure 3) that combines characteristics of a notebook and a spreadsheet. Our aim is to provide a tool that allows users to quickly and easily tabulate, visualize, clean, and summarize large datasets. As the user explores her data, Vizier provides a variety of tools for curation, from the ability to manually edit individual records, to batch operators that **automate common tasks** like schema merging, outlier detection, missing value imputation, entity resolution, constraint repair, and others. While the user is exploring and curating the data, Vizier records her curation activities to **incrementally build a workflow** [5, 51, 64, 65, 101, 105, 128, 202], as illustrated in Figure 2a. During this process, the system **recommends curation steps and tuning parameters** to the user based on successful past curation efforts on datasets with similar characteristics [200]. For example, the system may detect that the user is constructing a typical address cleaning workflow and suggest curation steps that are commonly used to clean addresses such as using an external zip-city lookup table. For large datasets, a user would typically first curate and explore a small sample and only **deploy** her curation workflow over the full dataset once she

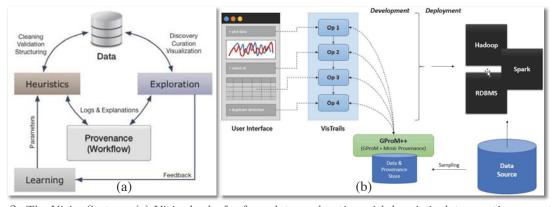

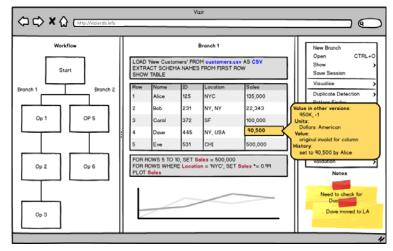

Figure 2: The Vizier System. (a) Vizier backs freeform data exploration with heuristic data curation operators and a feedback and provenance-driven learning engine that continually improves its curation heuristics. (b) Workflows are designed through Vizier's hybrid notebook-spreadsheet interface on small or sampled dataset processed locally by an engine backed by GProM and Mimir. When workflows are ready, they can also be deployed to the cloud, to a Hadoop or Spark cluster, or to a relational database system.

is sufficiently certain that the workflow resolves all data quality issues. This type of deployment at-scale is supported in Vizier, as illustrated in Figure 2b. One challenge in this setting is that the curation steps applied over the sample dataset need to be generalized to correctly apply to the full dataset. For example, the user may manually remove taxi trips with unrealistically large fare values from the sample dataset. However, the full dataset will contain many additional such trips that would not be removed when the workflow is deployed, unless the deletion of a fixed set of trips is *generalized* to a deletion of trips based on their fare value. Vizier aids the user in the deployment by providing recommendations on how to **generalize** her operations based on data characteristics and provenance. For example, the system may detect that all deleted trips have an unusually high fare in common and offer to delete all records with similarly high fares in one operation. Combining workflow provenance, data provenance, and uncertainty management, Vizier can offer non-intrusive visualizations that **fully explain** how data was produced and how ambiguities in the input data or curation steps have affected it. For example, clicking on a value in Vizier's interface will bring up an explanation view showing the value's provenance, ambiguities in its derivation, and how it compares to related values (e.g., those in the same column).

Interface. Vizier's interface (illustrated in Figure 3) combines elements of both notebooks and spreadsheets. Notebook interfaces like Jupyter use an analogy of pages in a notebook that consist of a block of code, as well as an output for the block like a table, visualization, or documentation text. Blocks are part of a continuous program, allowing a user to quickly probe intermediate state or to safely insert hypothetical, exploratory modifications by adding or disabling pages. Spreadsheets give users an infinite 2-dimensional grid of cells that can hold either constant values or computed values derived from other cells. Instead of classical programmatic specification of bulk, set-at-a-time operations, spreadsheets use the metaphor of copying code and relative, positional data dependencies to "map" operations over collections defined by contiguous regions of data. Thus, the ability to change any value anywhere in the execution process, and simple integrated visualizations combine to make spreadsheets a very viable tool for data curation and exploration. The simplicity of spreadsheets has encouraged many database-driven efforts to resolve the impedance mismatch between positional and set-at-a-time query semantics [132,160], make spreadsheets more structured [16,17] or make databases more spreadsheet-like [131]. Vizier builds on these efforts, creating a hybrid notebook-spreadsheet interface by making a notebook's output dynamic. Vizier's users can edit tables and visualizations directly, and have those edits reflected in the notebook's code block through database-style table updates. As a result, the user's edits, however they are applied, are recorded in the notebook as a part of the workflow (see Figure 2b). Although we will not reproduce the full spreadsheet interface entirely, our goal is to replicate as many of the flexible data and schema manipulation features of spreadsheets as possible. Vizier allows users to overwrite arbitrary values, embed formulas into table cells, cut/copy/paste cells, add (or delete) columns or rows, and sort or filter the data. In addition to low-level modifications, the user can also apply higher-level curation operations, including ones for which exact configuration parameters may not be known ahead of time (we return to this later). Unique to Vizier is its ability to present useful recommendations to the user based on provenance, to expose ambiguity through visual hints in the interface, and to explain why and how values where derived.

Incrementally building curation workflows. The workflows that are *incrementally* constructed based on the user's operations serve several purposes. By leveragering VisTrails [42, 99, 202] as a system to manage these workflows and their evolutionary construction through user actions [43], they allow seamless repeatability [9, 10]. This enables users to easily identify and revert erroneous changes and helps Vizier to learn from the user's activities. To support a user in efficiently revising a workflow, we can use provenance to propagate

changes to data and workflow steps throughout dependent workflow stages. Techniques such as program slicing [2,153,230] and incremental view maintenance [3,35,38,50,118,135,138,145] can help to improve the performance of this process. It can be further optimized in the case where update histories are available through a technique called reenactment which is readily supported in GProM [9,10].

Furthermore, a workflow generated for one dataset can be easily adapted for use with different, but similar data sets, a task for which research by PI Freire [200] provides a preliminary approach. Inputs can take the form of CSV files, relational database tables, JSON files, unstructured data, or external data sources like web APIs or HTML pages. Workflows are part of the extensive provenance tracking of Vizier [51,65], helping the user and her collaborators to explain the system's outputs and audit their curation and exploration activities. Unique to Vizier is that workflow steps are not considered as black boxes, but correspond to programs in a declarative language described below. Vizier also supports ambiguity-tolerant operators called lenses and tracks fine-grained provenance at the data level.

**Exploration, testing, and deployment.** As mentioned earlier, a user would typically want to design a workflow over a small sample dataset before testing or deploying it at scale. One of the compelling benefit of workflows is the ability to adapt and re-use them across different contexts. A data curation process *designed through an exploration-friendly spreadsheet* interface can then be adapted to other datasets, replicated for recurring data curation tasks like monthly reports, or run at scale on a cluster. Like Wrangler [121, 134], Vizier allows users to easily develop data curation workflows on a small sample of the data before scaling to tera- or peta-byte scale data on a Hadoop cluster or RDBMS. In contrast to Wrangler which forces users to generalize edits upfront, Vizier instead helps users to generalize a workflow that includes manual curation steps into a workflow suitable for the complete dataset.

**Curation DSL with Provenance.** Vizier's flexibility is derived, in part, from a new domain-specific language for exploratory curation that we will develop as part of the proposed work. The objective of this DSL is to *integrate closely with the interface* by ensuring a 1-1 mapping between operations in the language and edits to Vizier's tabular outputs. In addition to facilitating the hybrid notebook/spreadsheet environment, the Vizier DSL serves as an intermediary between the workflows and a variety of back-end execution environments. In addition to executing locally, we will develop modules to compile the Vizier DSL down to a variety of languages for deployment on external computing platforms, such as SQL for Relational DBs or Map/Reduce or Spark programs for cloud computing clusters. To maximize compatibility with GProM and Mimir, Vizier's DSL will start as an instance of classical extended-relational algebra [123]. For

a more user-friendly imperative flavor and to make it easier to mirror manual edits from the spreadsheet onto the target program, we will add operations from SQL's DML that edit specific fields, batches of fields, and insert or delete rows; operations from SQL's DDL that add, remove, and hide columns or manipulate constraints; and automated data curation operations based on Mimir's lenses, as discussed below. In spite of the imperative flavor of the language, these operators effectively modify a table-valued query "object" modelling the whole sequence of operations [9, 10], and can be thought of as operators in a relational monad [39] that can be reduced to a single query.

Taming uncertainty and explainability. Lenses [167,232], part of the Mimir system discussed below, are data curation operators that use heuristics to minimize or eliminate configuration. In lieu of configuration, a lens is allowed to produce multiple ambiguous *possible outputs* alongside a single best quess output. Possible outputs remain associated with the output of queries or transformations over lenses, allowing potentially ambiguous results to be identified and explained and allowing the uncertainty stemming from this ambiguity to be quantified. For example, depending on the user's goals outliers like the \$938 tip in the TLC dataset might be kept as-is, elided from the dataset, or replaced with a reasonable educated guess. In the latter case, there are also numerous heuristics that can approximate a user's best guess, including sequential interpolation along each of several candidate dimensions [59,67,136], a classifier trained on the adjacent attributes [228], a classifier that treats the data as the output of a Markov process [157,158], and numerous others. A user could be asked to select from among these options upfront, but she may not have sufficient information about the data to decide which is relevant (e.g., is the tip a data error or a legitimate outlier). Furthermore, depending on the user's goals, the choice may not even be relevant (e.g., she is generating a table of average tips by year). Workflows also provide context for data presented through the notebook interface. As illustrated in Figure 3, users can obtain statistics about output values through the Vizier UI, including the record's dependencies and formula, variations in the record's value over time, the system's certainty in the result (discussed further below), and other features like the set of of edits with the greatest impact on the value.

Automation and Recommendation. In keeping with best practices for user interface design [177], a goal of Vizier's interface is retaining the user's sense of control over the system's behavior. Accordingly, we adopt two general strategies for streamlining the user's interaction with the system that we refer to as Automation and Recommendation. Automation allows users to accomplish complex high-level tasks without concern for the low-level details of the task. Effective use of automation requires both the user's consent and awareness. as well as effective communication in the case of ambiguities. Automation in Vizier occurs through lenses. Lens behaviors are precisely defined in terms of desired effects. By requesting that a lens be applied, a user indicates both consent and an awareness of what the lens is trying to accomplish. As discussed above, ambiguities are communicated through explanations over results, minimizing upfront effort from the user, but keeping them aware of potential repercussions of using automated tools. By integrating these techniques into Vizier we enable users to combine these techniques with each other and with simpler manual curation operations (e.g., manually deleting dirty rows). Even more important, through their integration with Vizier, these operations can benefit from the uncertainty, provenance, recommendation, and deployment features of Vizier. Recommendations, instead help users to quickly reach relevant curation tools and to discover tools that they may not be aware of. Vizier uses a repository of collected provenance to provide suggestions to the user based on the current workflow and data characteristics. This is similar to Wrangler [134] which trains a Markov model on sequences of transformations to suggest transformations commonly performed together in sequence. However, our recommendations are much more advanced in that they are not just based on the current structure of the workflow, but also on the fine-grained data and workflow provenance. Four types of recommendations will be supported: (1) Recommendations on how to tune the parameters of a cleaning operation in the workflow. For example, the sensitivity of an outlier detection step could be tuned based on successful values for past outlier detection methods over data with similar characteristics. Similarly, if a past workflow containing a particular data curation operation has a similar structure as the current workflow this can also be an indication that similar tuning parameter values should be applied; (2) Recommendations on which data curation steps to apply next. These recommendations will be based both on the characteristics of the workflow as well as the data. (3) Recommendations on how to generalize specific curation steps, e.g., updating values based on a condition instead of updating a fixed set of rows. (4) Finally, Vizier offers facilities for automated data discovery, both through simple keyword search, and offering suggestions based on datasets frequently used together.

### 2.1 Comparison to Existing Tools

Spreadsheets are an extremely common tool for data curation. Vizier borrows the structural and visual programming elements of spreadsheets, allowing users to freely interact with data and gracefully supporting corner cases. Although Vizier will not provide full freedom of spreadsheets, curation efforts on spreadsheets can not be easily generalized into repeatable, shareable workflows. Scripting languages like Python are another common tool for curation work, but suffer from several limitations that Vizier addresses. First, the link between output and code is unidirectional: Edits to the output are overwritten the next time the code runs, making it harder to apply one-off changes or to explore hypothetical what-if scenarios. Moreover, once a curation script is developed through interactive design, it must still be manually adapted for parallel execution via map/reduce or a tool like apache spark [212].

Recently, several new tools for data cleaning or "wrangling" have emerged from academia and industry and are gaining traction in the data science community. NADEEF [61, 73, 74, 82] uses a rule-based system to detect and repair violated constraints. The set-at-a-time interaction model of a rule-based system works well when a user knows what properties the data should satisfy upfront, but does not permit easy discovery of such properties as in Vizier. SampleClean [122, 154, 229] uses sample-based cleaning to make unbiased estimates for aggregate results over messy or dirty data; This technique is orthogonal to Vizier's workflow generalization, and could conceivably be eventually incorporated into Vizier. Habitat [130] is an extensible framework for data curation, provenance, and discovery, into which specialized modules and interfaces can be deployed; Vizier could eventually be adapted to use Habitat as a deployment target. The Data Tamer project [120, 213], commercialized as Tamr, focuses more on data integration issues like schema matching and entity resolution. These are both important tasks in data curation, and appear as operators in Vizier.

The most similar production system is the Wrangler [121, 134, 185] project, commercialized as Trifacta [220]. Here too, the goal is to develop a repeatable curation workflow. We borrow Trifacta's samplebased development model, its ability to apply global edits directly on its output, as well as the idea of predictive suggestions. However, Vizier distinguishes itself in four ways. First, Trifacta forces users into the clean-before-use model and is thus optimized for developing only generalized set-at-a-time cleaning programs. Second, Vizier's notebook metaphor allows users to explore the data simultaneously from multiple perspectives or with different hypothetical modifications. Third, Vizier tracks provenance through the workflow, making it easier to debug values and sanity check results. Finally, provenance also permits Vizier to *safely* automate common tasks, even in the presence of ambiguity; if they are later found to be incorrect, the operations can be undone.

### 2.2 VisTrails

The open-source VisTrails system was designed to support exploratory and creative computational tasks [41,86,100,133,204,210,224,225], including data exploration, visualization, mining, machine learning, and simulations. The system allows users to create complex workflows (computational processes) that encompass important steps of data science, from data gathering and manipulation to complex analyses and visualizations. A new concept we introduced with VisTrails is the provenance of workflow evolution [40,98]. In contrast to previous workflow and visualization systems which maintain provenance only for derived data products, VisTrails treats workflows as firstclass data items and maintains their provenance (see version tree in Figure 4). Workflow evolution

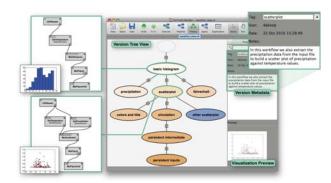

Figure 4: In VisTrails, provenance of exploration is represented as a version tree. Each node represents a workflow and an edge between two nodes encodes the set of changes applied to the parent to derive the child.

provenance supports reflective reasoning, allowing users to store temporary results, to make inferences from stored knowledge, and to follow chains of reasoning backward and forward [176]. It also works as a version control system for computational pipelines, thus naturally supporting collaboration [78]. Users can easily navigate through the space of workflows created for a given investigation, visually compare workflows and their results, and explore parameter spaces [98]. Users are encouraged to re-use knowledge by exploring and leveraging provenance information through specific, easy-to-use components. These include a query-by-example interface, a mechanism for refining workflows by analogy [203], and a recommendation system that aids users in the design of workflows [152]. Pipelines and their provenance can be shared through Web-based interfaces, allowing others to validate and reproduce computational experiments [161, 192, 197]. The system has an active community of developers and users and has been adopted in several scientific projects, both nationally and internationally, across different domains. It has enabled and supported new research in environmental science [18,48,58,127,129], psychiatry [8], astronomy [219], cosmology [7], high-energy physics [68], molecular modeling [124], quantum physics [29,85], earth observation [60,222] and habitat modeling [165]. Besides being a stand-alone system, VisTrails has been used as a key component of domain-specific tools including DoE's UV-CDAT [191,195,221]; USGS's SAHM [165,190]; and NASA's DV3D [227]. VisTrails was featured as an NSF Discovery [178].

### 2.3 Mimir

Mimir [167, 231, 232] is a system that extends existing relational databases with support for socalled on-demand, or pay-as-you-go data curation through lenses, already introduced above in the description of Vizier. Mimir's support comes through a form of an annotated cursor that identifies ambiguous values and rows who's presence in the result set is ambiguous. Furthermore, the annotated cursor can explain ambiguity, both through English statements like "I replaced TIP with NULL on row 5239865 because you asked me to remove outliers," and by quantifying the effect of ambiguity on results, as in "the AVERAGE(TIP) is  $10 \pm 2$  with 95% confidence". To convey the output of this annotated cursor to users, Mimir's front-end interface (illustrated in Figure 5) provides a standard SQL interface (a). Ambiguous outputs are marked (b), and in addition to show-

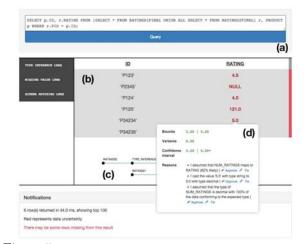

Figure 5: Mimir's User Interface shows and explains uncertain or ambiguous data

ing their lineage (c), Mimir produces explanations (d) upon request.

### 2.4 GProM

GProM (Generic **Provenance Middleware**) [10, 11, 113, 174, 175] is a database-independent middleware for tracking and querying fine-grained provenance of database queries, updates, and transactions (see Figure 6). GProM supports multiple database backends and can be extended to new backends through plugins. The user interacts with the system through one of the system's declarative frontend languages (currently dialects of SQL and Datalog with constructs for requesting provenance). Impor-

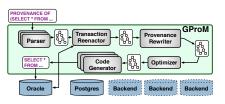

Figure 6: GProM system overview

tantly, GProM tracks data provenance in a non-intrusive manner, without requiring any changes to applications or the database backend. Using **reenactment** [10], a declarative replay technique which simulates the effects of past updates or transactions using queries with time travel, the provenance of an update or transaction is computed retroactively through replaying the operation instrumented to capture provenance. Time travel is supported by most commercial systems and can be implemented using, e.g., triggers in systems that do not support it natively (see, e.g., [211]). GProM will be used to supply fine-grained provenance for curation operations be they queries or updates. Vizier uses this functionality to generate explanations for curated data and the curation process as well as to extract training data for the recommendations based on provenance. Furthermore, using reenactment it is possible to efficiently propagate changes to data and operations through a workflow during the exploratory phase of curation workflow construction.

## 3 Management Plan

Our implementation strategy for Vizier is to gradually integrate these three systems into a front-end interface that combines elements of VisTrails and Mimir, and a back-end component combining elements of Mimir and GProM. Our approach is iterative: many of our deliverables are useful stand-alone data curation tools in their own right that become progressively more powerful as they are extended and combined.

**Task 1: Bulletproof GProM and Mimir.** Both GProM and Mimir are stable enough for general use, but have primarily been developed as proofs of concept. The first task will be to thoroughly stress-test both systems to identify and repair any bugs, and to evaluate whether any critical core functionality necessary for Vizier is missing from either system.

Deliverable: Production quality releases of GProM and Mimir

**Task 2: Unify GProM and Mimir.** Our first integration target will be the back-end for Vizier: a data processing system with fine-grained provenance support, able to link outputs to edits applied both by users and by automated curation tasks. The back-end component will combine GProM's reenactment facilities with support for Mimir's lenses and explanations of ambiguity.

**Deliverable**: A provenance and ambiguity-aware data processing system supporting queries and updates

**Task 3:** Add a notebook Interface to VisTrails. VisTrails will serve as a central dispatcher for Vizier, linking the front-end interface to the fine-grained provenance and data-processing capabilities of the backend developed in Task 2. In this task, we will extend VisTrails with a UI shell based on Jupyter notebook, which will eventually serve as a front-end for Vizier. For this task, like VisTrails, the notebook shell will remain agnostic to the implementation of workflow steps.

Deliverable: A notebook-style UI for VisTrails

**Task 4: The Vizier DSL.** In parallel with the previous tasks, we will begin a research effort to design a DSL for our hybrid notebook/spreadsheet environment. As noted, our starting point will be relational algebra with additional operations based on SQL's DDL and DML, Mimir's lenses, as well as operators from existing data curation systems like Wrangler or NADEEF. Our goal is to create a language with a 1-1 mapping between edits applied to notebook's tabular output and the program generating that output. **Deliverable**: A language specification for Vizier's DSL and compliant parser

Task 5: A Prototype of Vizier's Hybrid Notebook and Spreadsheet UI. As the DSL and the front- and back-end components mature, we will begin integrating them together using the DSL as glue. The first part of the integration process will be to create the hybrid notebook/spreadsheet UI proposed earlier by enabling spreadsheet-style editing for the notebook's tabular outputs. We then also need to create the UI elements necessary to mirror edits between the spreadsheet and code elements. Time permitting, we will explore visual cues to help users to follow the flow of code or data dependencies.

**Deliverable**: A prototype front-end for Vizier

**Task 6: Implement the DSL in the Vizier Back-End.** Simultaneously, we will add DSL support to the back-end. Both GProM and Mimir use an intermediate representation similar to relational algebra with updates. We anticipate that it will be possible to implement the DSL with minimal extension to this basic model (e.g., GProM already supports multiple front-end languages and, thus, it is reasonable to assume that adding support for the DSL would be possible with reasonable effort). Our initial plan will be to support local evaluation of the DSL on common formats including CSV and JSON, first to permit low-latency development, and second to create a prototype as quickly as possible. We will return to add support for partial or full deployment to external data management systems later (Task 8). **Deliverable**: A back-end with support for the Vizier DSL.

**Task 7: Link the Back- and Front-end components.** The DSL developed in Task 4 serves as a common interface between the front- and back-end components of Vizier. Tasks 5 and 6 prepare these components for integration, establishing a DSL-aware front-end, and a back-end capable of evaluating DSL programs. We anticipate this task to require only minor refinements, but extensive stress-testing.

**Deliverable**: A beta version of Vizier

**Task 8: External Datasource Connectors.** Our next goal will be to enable access to data hosted in distributed resources such as relational databases, HDFS clusters, NoSQL data stores, generic REST APIs and other internet resources. A connector will require three components: First a way to access the complete data, second a way to sample from the available data, and finally an optional DSL translator to allow Vizier to deploy workflows to it.

**Deliverable**: Connectors between Vizier and external data sources

Task 9: Extending Mimir's Library with Automated Data Curation Operations. With the intent of getting users up and running as quickly as possible, our next goal will be to extend Mimir's existing library of Lenses with new data curation operations as well as operations that evaluate data quality and unearth interesting features of the data. Our initial goal will be to develop three modules: One for identifying potential outliers in a dataset [119], one for detecting correlations or dependencies between attributes and/or successive rows, and one for suggesting visual representations of a dataset [151]. We will revise this list based on feedback from our user community collaborators.

Deliverable: Extended library of automated data curation operations and quality evaluation modules

**Task 10:** Provenance-based Suggestions. Vizier will track the user's activities as a way to explain outputs to the user. The system will leverage the resulting repositories of both workflow provenance and fine-grained data provenance to offer suggestions to users [152,200], e.g., by identifying common relationships between user edits [134] or common properties of data elements that the user appears to be trying to fix. **Deliverable**: Automatic provenance-based recommendation module

**Task 11: Revise and Refine.** We anticipate active community involvement in the development of Vizier. However, once we have assembled a beta version of the complete system, we expect to receive a substantially higher volume and quality of feedback from our collaborators and users. Our timeline includes an explicit period in which we expect to focus entirely on revising and refining the system.

Deliverable: A full release of Vizier

**Task 12: Version Tree Operations.** The change-based provenance adopted by VisTrails enables a series of operations that streamline exploration, including the ability to visually compare workflows [98] and to modify workflows by analogy [203]. We will extend VisTrails to support additional operations, including the ability to merge/reconcile curation workflows and propagate updates to multiple workflows. **Deliverable**: A comprehensive set of version tree manipulations required by exploratory curation

### 3.1 Development Timeline

We have prepared a 3-year development timeline. In addition to the 3 PIs and a senior research engineer responsible for the project, we have budgeted for 4 students, 1 post-doctoral associate, and 2 developers for the full 3 years. The post-doc and developer hosted at NYU will be responsible for the implementation of Tasks 3-5, 7, 9-12. One developer hosted at UB will be implement the components in Tasks 1-2, 4, 6-8, 11. Students, one hosted at NYU and UB each, and two hosted at IIT, and the post-doc will be responsible for research & development components of the proposal. The post-doc will also serve as a bridge to our collaborators and work on outreach, giving talks and tutorials about the system. A yearly demonstration of technical capabilities, as requested by the DIBBS solicitation, will be based on the deliverables described for each task above, grouped into yearly units of work as described below.

**Year 1.** Preliminaries: Bulletproofing and unifying GProM and Mimir (Tasks 1-2) and preparing the user interface (Task 3). While these tasks are underway, all three sites will collaborate on a research effort to design a notebook/spreadsheet DSL (Task 4). Towards the end of the year, we expect both developers to begin prototyping efforts for their respective parts of Vizier (Tasks 5-6).

Year 2. Continued efforts to prototype the Front- and Back-end components of Vizier: We expect to see early efforts to integrate both elements (Task 7) begin early-to-mid year 2, and a beta version of the system

available late in year 2. Research efforts in year 2 will include a preliminary exploration of provenance-aware learning and heuristic quality assessment (Tasks 9 and 10), and performance-tuning, for example through techniques like reenactment and incremental maintenance (Task 11).

**Year 3.** Year 3 will serve as a buffer for time-overruns and as a period of refinement: improving compatibility (Task 8), making Vizier smarter (Tasks 9 and 10), and incorporating community feedback (Task 11) and adding versioning (Task 12).

### 3.2 Evaluation Strategy

As our goal is to simplify data curation, we will evaluate Vizier and its components primarily through community feedback and expert studies facilitated by our collaborators. We will also conduct user studies to evaluate the effectiveness of specific features or interface elements on an as-needed basis, pending IRB approval for each case. As performance is also a significant user concern, we will evaluate Vizier's back-end components using data from collaborators including Airbus and the NYC Taxi and Limousine Commission, standard benchmarks like the MayBMS probabilistic data benchmark [217], openly accessible datasets, and benchmarking tools for cleaning and integration [12–15].

With the exception of Tasks 4–6, each sub-goal results in a complete software artifact that can be evaluated in isolation. Tasks 1–3 result in stand-alone components with clear, self-contained goals. Tasks 7–12 result in versions of Vizier with progressively more features that can be evaluated through expert studies and deployment at our collaborator's sites. In each case, the task has clear, measurable deliverables. The interface design of Task 5 will be evaluated and refined primarily through expert studies, and IRB approval permitting, user studies as well. The back-end design of Task 6 will be evaluated in terms of its performance and compliance with the DSL's specifications. The DSL created in Task 4 will be evaluated and refined based on its suitability for Tasks 5 and 6.

### 3.3 Risk Mitigation

The primary elements of Vizier are already well-established systems and we do not anticipate any significant issues with the feasibility of the proposed system. One possible risk is time overruns due to unforeseen difficulty or unexpected events. To mitigate this risk we have budgeted a part of year 3 as a buffer. If absolutely necessary, we can also scale back the goals of Tasks 8-10 to ensure the delivery of a stable system by the end of the grant period. Another risk is that of a developer leaving. We will mitigate this potential risk to institutional knowledge by ensuring that developers actively document their efforts, holding regular code reviews, and ensuring that the student researchers are actively engaged in the design process with the developers. A third risk is the possibility that by the time a prototype of Vizier is ready, our collaborators will no longer be able to provide us with their expected contributions. To mitigate this risk, we have engaged a large, diverse group of collaborators and will continuously seek out new partnerships over the course of the grant. Finally, the risk of running out of development resources is addressed in our sustainability plan.

### 4 Sustainability Plan

To ensure the continuation of the project beyond the three year grant period, we will build on our existing efforts to establish a strong community of users and developers with a vested interest in Vizier. To this end, we have already engaged a diverse set of expert leaders from communities in industry, academia, and government, all interested in actively participating in the design of Vizier and helping us to evaluate and refine the results. Our preliminary set of collaborators includes representatives from NYU's Center of Urban Science and Progress (CUSP), Furman Center, The Airbus group, the NYC Taxi and Limousine Commission (TLC), and Oracle (see letters of collaboration). Oracle, in particular, has already been supporting PIs Kennedy and Glavic's research through unrestricted gifts for the past 2 and 3 years, respectively. Their collaborators at Oracle, Dieter Gawlick and Zhen Hua-Liu, actively provide feedback and guidance for the Mimir and GProM projects. We have also begun efforts to reach out to additional communities (e.g., the informal survey in Section 1.3). We will expand on these efforts as additional components of Vizier are completed through further surveys, workshops, webinars, and demonstration videos. We have also budgeted for a publicly-available demonstration release to be hosted on a cloud-computing platform.

Our primary approach to building community buy-in will be to engage prospective users in the design and development of Vizier. The first step in this process will be to release Vizier under a permissive license (e.g., Apache), and provide access via a public code repository such as GitHub. However, simply releasing code is insufficient to build an engaged community. Ensuring high-quality user and developer documentation, as well as well-structured, well-commented, and readable code will help newcomers to make use of Vizier, and eventually to extend it as well. A stable community also needs communication. We will ensure the availability of vectors for both asynchronous communication (e.g., wikis or bug/feature request trackers) and synchronous communication (IRC, Slack, or similar) with project staff. We note that the use of such tools for communication is already necessary to support collaboration between the three project sites and that making these resources publicly accessible presents a negligible overhead. Finally, to provide the community with effective leadership, we will establish a common set of guidelines for code review and community governance during our first annual on-site meeting, and will review these guidelines during subsequent annual meetings.

### 5 Collaboration Plan

The PIs will closely collaborate on the project and synchronize their work progress using bi-weekly virtual meetings. These meetings will be attended by the PIs, the developers funded through this project, involved Ph.D. students and PostDocs, and collaborators from the target communities (see letters of collaboration). The purpose of these meetings is to (1) plan short-term and long-term implementation efforts, (2) elicit feedback from community leaders on the current version of the Vizier system, (3) strategic planning of development direction, and (4) coordination among all involved project sites. All three PIs have extensive experience working with users from the sciences and industry and have been involved in collaborations that span multiple disciplines. The PIs and project staff will also meet in person regularly at conferences (funds for conference travel are included in our respective budgets), and at a yearly on-site meeting. We have budgeted travel funds to allow PIs, developers, students, PostDocs, and key collaborators from target communities to gather at a single (rotating) project site for a workshop event once per year. These yearly meetings will revolve around a series of lightning talks from project staff to convey detailed information about each group's activities, areas of expertise, and project requirements. The lightning talks will be followed by a strategic planning session, a review of project and community governance policies, a breakout session for free-form discussions among project participants, and a wrap-up discussion to discuss outcomes arrived at during the break-out sessions. The PIs are using web-based collaboration software called GitLab that provides document sharing, a collaborative wiki, a bug tracker, and other tools for group management, as well as other cloud collaboration tools like Dropbox and Skype. If funded, project staff will also deploy and use tools for community-management, including group chat software (e.g., Slack, IRC, or similar), forums (e.g., PHPBB or Disgus), and blogging software (e.g., Wordpress). Finally, when Vizier is ready for a preliminary release, we will begin hosting it on a public open-source code repository such as GitHub.

## 6 Broader Impacts

The overarching goal of this proposal, to simplify data curation and exploration, has the potential to be transformative and positively impact the state of data science in many different domains. Our initial set of collaborators (see attached letters) includes representatives from government (TLC), academia (NYU's CUSP and Furman Center), and industry (Oracle and Airbus), all heavily invested in the issues of data quality that we are poised to address. Our informal survey turned up numerous colleagues and collaborators from across multiple fields of research and sectors of industry, all of whom grapple with data quality on a regular basis. Thus, the impact of the project can be immediate. Besides advancing the state of the art in data curation, the proposed work will improve research in other fields, notably, in social sciences. It will also contribute to an emerging field: urban science. Through the deployment of our tools within CUSP and the Furman Center, our work has the potential to impact a wide range of scientists and students, as well as the NYC agencies that are partnering with CUSP and Furman on various projects. If successful, our work will positively impact government by improving data quality, which in turn will lead to better planning and policies and more efficient operations. The ability to publish provenance-rich, high-quality data will also positively impact governance and citizen engagement.

Integration of Research and Education. We see education in a broader context. In our interactions with

domain scientists, it has become clear that many of them are not up-to-date of recent developments around data curation techniques and tools. Thus, we believe that we not only need to educate our own students, but also inform the scientific community at large of the benefits and technologies related to curation. We are well positioned to reach "across our disciplines", given our on-going multi-disciplinary collaborations and the make up of our team. Four PhD students and one Postdoctoral researcher will participate in this project. The grant will also support the PIs in their existing educational outreach efforts: PI Kennedy is working with contacts at local high schools, gained through his membership in the WNY chapter of the ACM Computer Science Teacher's Association, to develop an open-data after-school program at high schools near UB. PI Glavic is actively working on integrating data cleaning and integration into IIT's CS graduate programs including the development of a new course on data integration and provenance. Vizier will be used as a tool in future installments of this course.

Minority and Undergraduate Involvement. We are committed to recruiting and mentoring minorities. All the PIs have been involved in different efforts to foster minority involvement. NYU Tandon School of Engineering ranked #1 in the nation by US News and World Report in Racial Diversity, and #3 in Economic Diversity among private universities in 2009. Typically, around half of our incoming domestic CS Ph.D. students are women or underrepresented minorities. It is well known that attracting minorities to STEM fields has been a great challenge. We believe that our research topic can contribute to attracting more minorities to computer science. The M.S. progrems at NYU CUSP and at NYU CDS (which PI Freire directs) have close to 50% female enrollments. If funded, the PIs will also apply for REUs to facilitate involvement from undergraduate researchers at their respective universities.

**Technology Transfer and Software Tools.** Our team has an unassailable record of translating research results into practice across the sciences, including urban science, as well as to government, industry, and the general public. The software we will develop will be released as open source. Value-added open data derived by our methods will also will be made available under creative commons licenses where permitted.

## 7 Results from Prior NSF Support

**Dr. Oliver Kennedy.** Dr. Oliver Kennedy has been tenure-track faculty since Fall of 2012 and has been a PI on one NSF award. *Intellectual Merit:* Since receiving his first award 1.5 years ago, Dr. Kennedy's funding has resulted in 2 workshop publications [155,156] and one further conference paper under submission. *Broader Impacts:* NSF: CNS-1409551 (2014-2018; \$976k) has funded the development of Ettu, a tool for summarizing query logs to enable insider threat analysis, as well as the collection and anonymization of a one-week trace of *all* SQL query activity at a major US bank. The project actively supports three PhD students, and an REU supplement is actively supporting one undergraduate and supported one undergraduate student who graduated in Winter of 2015. One graduate student has completed his thesis under Dr. Kennedy's supervision. Dr Kennedy is currently advising 5 PhD students (including 2 female students), one MS student, and one BS student, and co-advising 3 PhD students (including one female student).

**Dr. Juliana Freire.** Since joining academia in late 2002, Dr. Freire has been PI, co-PI, or senior investigator on fourteen NSF awards. *Intellectual Merit:* Dr. Freire's NSF funding has resulted in over 87 publications [4, 6, 18–27, 29, 30, 37, 40, 41, 44, 52–56, 63, 66, 71, 72, 75, 78–81, 83, 84, 86–88, 90, 91, 93, 94, 96–98, 100, 104, 127, 146–150, 152, 152, 159, 161–164, 166, 169–172, 172, 173, 186, 187, 193–199, 201, 203, 204, 206–208, 210, 223, 226], including a IEEE Visualization 2007 best paper award and an Eurographics Educational Program best paper award. *Broader Impact:* NSF IIS-0513692 (2005-2008; \$499k)) [95] and NSF CNS-1405927 (2014-16; \$530k) [92] have funded the development of VisTrails [86,224], an open-source data analysis and visualization tool that provides a comprehensive provenance infrastructure. VisTrails has been adopted in several scientific projects, both nationally and internationally, including in large NSF-funded projects [57, 58, 62, 188]; and it has had impact in different scientific domains [7, 8, 18, 48, 58, 68, 124, 127, 129, 219]. Thirteen graduate students have completed their degrees under Dr. Freire's supervision—these include five female and three Hispanic students. She has also supervised post-doctoral assistants and several undergraduate students. She currently advises 7 Ph.D. students, 5 of which are from under-represented minorities.

**Dr. Boris Glavic.** does not have NSF support yet. He is currently advising three Ph.D. students (one female), three MS students, and is co-advising one Ph.D. student.

## **Biographical Sketch**

## Education (Chronological)

• New York University; New York City, NY, USA (Major: Comp. Sci.)	B.S. 2005
---	-----------

- Stevens Institute of Technology; Hoboken, NJ, USA (Major: Comp. Eng.) B.E. 2005
- Cornell University; Ithaca, NY, USA (Major: Comp. Sci.) M.S. 2009
- Cornell University; Ithaca, NY, USA (Major Area: Comp. Sci.) Ph.D. 2011 Dissertation Title: "Watch out for... What?: Monitoring and Uncertainty in Scientific Computing" Advisor: Christoph Koch

## Professional Appointments (Reverse Chronological)

•	Assistant Professor,	Comp. Sci. and Eng., S	UNY at Buffalo	Aug 2012–present
•	Postdoctoral Fellow,	Faculté IC, EPFL Switz	erland	June 2011–July 2012

## Five Products Closely Related to Proposed Project

- 1. "Lenses: An On-Demand Approach to ETL" (paper; Yang, Meneghetti, Fehling, Hua-Liu, Kennedy) *VLDB* 2015
- 2. "Detecting the Temporal Context of Queries" (paper; Kennedy, Yang, Chomicki, Fehling, Hua-Liu, Gawlick) *BIRTE* 2014
- 3. "Jigsaw: Efficient optimization over uncertain enterprise data" (paper; Kennedy, Nath) SIGMOD 2011
- 4. "PigOut: Making Multiple Hadoop Clusters Work Together" (paper; Jeon, Chandrasekhara Shen, Mehra, Kennedy, Ko) *IEEE BigData* 2014
- 5. "Just in Time Datastructures" (paper; Kennedy, Ziarek) CIDR 2015

### **Five Other Significant Products**

- 1. "PIP: A Database System for Great and Small Expectations" (paper; Kennedy, Koch) *ICDE* 2010
- 2. "DBToaster: Higher-order Delta Processing for Dynamic, Frequently Fresh Views" (paper; Koch, Ahmad, Kennedy, Nicolic, Nötzli, Lupei, Shakhana) *VLDBJ* 2014
- 3. "Pocket Data: The Need for TPC-MOBILE" (paper; Kennedy, Ajay, Challen, Ziarek) TPC-TC 2015
- 4. "maybe We Should Enable More Uncertain Mobile App Programming" (paper; Challen, Ajay, DiRienzo, Kennedy, Maiti, Nandugudi, Prasad, Shantharam, Shi, Ziarek) *HotMobile* 2015
- 5. "Ettu: Analyzing Query Intents in Corporate Databases" (paper; Kul, Luong, Xie, Coonan, Chandola, Kennedy, Upadhyaya) *ERMIS* 2016

## Selected Professional and Synergistic Activities

- Professional Memberships: ACM (SIGMOD, CSTA), IEEE
- Teacher Development Workshops at WNY-CSTA (Fa2012), CSTA CS4HS (2013, 2014); with Lukasz Ziarek and Sarbani Banerjee
- PC/Panel Member: SIGMOD (2015-2017), VLDB (2017) NSF (2014-2015), SIGMOD Reproducability (2015-2016), HILDA (2016), ProvenanceWeek (2016)
- CSTA WNY Chapter Secretary (2014-2015)
- Volunteer: Science is Elementary-Buffalo, Liberty Partnerships

## Biographical Sketch Dr. Juliana Freire

Department of Computer Science and Engineering New York University 6 Metrotech Place, Brooklyn, NY 11201

**Professional Preparation** 

Federal University of Ceará (Brazil)Computer ScienceB.S., 1991State University of New York at Stony BrookComputer ScienceM.S., 1992State University of New York at Stony BrookComputer SciencePh.D., 1997

## Appointments

NYU Moore Sloan Data Science Environment	Executive Director	7/2015 -
NYU Center for Data Science	Professor	7/2014-
NYU Center for Data Science	Director of Graduate Studies	7/2014-
NYU Center for Urban Science and Progress	Faculty Member	2/2014-
New York University	Professor	1/2014-
Polythechnic Institute of New York University	Professor	7/2011 -
Courant Institute, New York University	Affiliated Professor	12/2011-
University of Utah	Associate Professor	7/2008-6/2011
University of Utah	Assistant Professor	7/2005- $6/2008$
OGI School of Science & Engineering at OHSU	Assistant Professor	9/2002 - 6/2006
Bell Labs Research, Lucent	Member of Technical Staff	12/1997 - 9/2002

## Products

### Five most relevant products

- 1. Collecting and Analyzing Provenance on Interactive Notebooks: When IPython Meets No Workflow. J. Pimentel, V. Braganholo, L. Murta, and J. Freire. Proceedings of USENIX TAPP, 2015. Open-source system available at https://github.com/gems-uff/noworkflow.
- 2. An Urban Data Profiler. D. Ribeiro, H. Vo, C. Silva, and J. Freire. Proceedings of WWW, pp. 1389-1394, 2015.
- Using Topological Analysis to Support Event-Guided Exploration in Urban Data. H. Doraiswami, N. Ferreira, T. Damoulas, J. Freire, and C. Silva. IEEE TVCG, 20(12), pp. 2634-2643, 2014.
- Structured Open Urban Data: Understanding the Landscape. L. Barbosa, K. Pham, C. Silva, M. Vieira, and J. Freire. Big Data Journal, 2(3): 144-154, 2014.
- Visual Exploration of Big Spatio-Temporal Urban Data: A Study of New York City Taxi Trips. N. Ferreira, J. Poco, H. Vo, J. Freire, and C. Silva. IEEE TVCG 19(12): 2149-58, 2013. Open-source system available at https://github.com/ViDA-NYU/TaxiVis.

### Five other relevant products

 Towards Understanding Real-Estate Ownership in New York City: Opportunities and Challenges. T. Hoang-Vu, V. Been, I. G. Ellen, M. Weselcouch and J. Freire. Proceedings of the Workshop on Data Science for Macro-Modeling, 2014.

Phone: (718) 260-4128 juliana.freire@nyu.edu

jununu.jrene@nyu.

- 2. Making Computations and Publications Reproducible with VisTrails. J. Freire and Clúdio Silva. Computing in Science and Engineering 14(4): 18-25, 2012. Open-source system available at http://vistrails.org.
- VisComplete: Automating Suggestions for Visualization Pipelines, D. Koop, C. Scheidegger, S. Callahan, H. Vo, J. Freire, and C. Silva. IEEE Transactions on Visualization and Computer Graphics, 14(6), pp. 1691-1698, 2008.
- Provenance for Computational Tasks: A Survey, J. Freire, D. Koop, E. Santos, C. Silva. In IEEE Computing in Science & Engineering, 10(3), pp. 11-21, 2008.
- Querying and Creating Visualizations by Analogy, C. Scheidegger, H. Vo, D. Koop, J. Freire, C. Silva. IEEE Transactions on Visualization and Computer Graphics, 13(6) pp. 1560-1567. Best paper award at IEEE Visualization 2007.

## Synergistic Activities

- Awards: ACM Fellow, 2014; Google Faculty Award, 2013; NSF CAREER, 2008; IBM Faculty Award, 2008 and 2014; Best paper award at IEEE Visualization 2007; Best paper award at Eurographics Educator Program, 2010; Best poster award at SBBD2009.
- Conference organization: Demo Program Chair: ACM SIGMOD, 2015. Group Leader: ACM SIGMOD, 2012 and 2017. Program Chair: Experiment and Analysis Track of the International Conference on Very Large Databases (VLDB), 2012. Program Chair: Workshop on the Theory and Practice of Provenance (TAPP), June 2011. Program Chair, World Wide Web Conference (WWW), April 2010; Program Chair, International Provenance and Annotation Workshop (IPAW), June 2008; Program Chair, HPDC Provenance Challenge Workshop, June 2007; Program Vice-chair, International World Wide Web Conference (WWW), 2005, 2008;
- Program Committee Member: (over 70 events, including) International World Wide Web Conference (WWW), 2000–2003, 2005–2008; ACM SIGMOD International Conference on Management of Data (SIGMOD), 2004, 2007, 2012, 2014; International Conference on Very Large Databases (VLDB), 2003, 2007, 2008, 2012; IEEE International Conference on Data Engineering (ICDE), 2001, 2002, 2005, 2007, 2008;
- **Boards:** VLDB Journal, IEEE Data Engineering Bulletin, IEEE Transactions on Knowledge and Data Engineering, Journal of Information and Data Management, VLDB Endowment, NYC Taxi & Limousine Commission (TLC) Data/Technology Advisory Committee, SOCIAM Project (UK).
- Minority Involvement: Chair of the Diversity and Outreach committee, School of Computing, University of Utah (2007-2009); Member of the Academic Alliance for the National Center for Women in Technology (NCWIT).

### Biographical Sketch Boris Glavic, Assistant Professor

Illinois Institute of Technology, Department of Computer Science, Stuart Building, 10 West 31st Street, Chicago, IL 60616. Phone: 312-567-5205. Email: bglavic@cs.iit.edu.

#### a. Professional Preparation

RWTH Aachen University of Zurich		n, Germany , Switzerland	Computer Science Computer Science	Diploma Ph_D	(2005) (2010)
University of Toronto		o, Canada	Computer Science		(2010) (2010 - 2012)
b. Appointments					
Adjunct Assistant Pro	fessor	University of	Toronto, Toronto, C	anada	(2016-present)
(Status only)					
Assistant Professor		-	of Computer Science, chnology, Chicago, U		(2012-present)
Post-Doctoral Fellow		-	of Computer Science, Coronto, Canada	University	(2010-2012)
Research Assistant		-	of Computer Science, rich, Switzerland	University	(2005-2010)

#### c. Products

- [5] B. Glavic and G. Alonso. Provenance for Nested Subqueries. In EDBT, pp. 982–993, 2009.

## d. Synergistic Activities

#### (i) Program Committee Member and Chair

- 2017 SIGMOD, VLDB
- 2016 IPAW (PC Chair), SIGMOD, ICDE (demo)
- 2015 SIGMOD, SIGMOD (demo), EDBT, ICDE, DATA, TaPP, WebDB, WBDB
- 2014 SIGMOD (demo), TaPP, DATA
- 2013 WBDB, TaPP, SSDBM
- 2012 AWM
- 2011 SIGMOD

## (ii) Journal Reviewer

- 2015 The VLDB Journal, Information Systems, Artificial Intelligence Review, JBI
- 2014 The VLDB Journal, ACM JDIQ
- 2013 ACM TOIT, IEEE TKDE
- 2012 ACM TODS
- 2011 ACM TODS, IEEE TKDE

## (iii) Teaching

Hot topics in database systems: Data Provenance, Computer science for economists II (part 1) - introduction to databases, Advanced Database Organization, Database Organization, Data Integration, Warehousing, and Provenance, Doctoral Seminar.

### (iv) NSF Panel Reviews, other Grant Reviews, Event Reviews

- 2016 Israel Science Foundation (ISF) Grant Review
- 2015 Fields Institute, Toronto Event Proposal Review
- 2014 Marsden Fund Grant Review (The Royal Society of New Zealand)
- 2013 NSF CISE-IIS panel

## (v) University

Member of the graduate admission committee, Editor of the department newsletter, Member of the undergraduate committee.

## Biographical Sketch Dr. Heiko Müller

Center for Data Science New York University 726 Broadway, New York, NY 10003 Phone: (929) 392-7621 heiko.mueller@nyu.edu

## **Professional Preparation**

Technical University of Berlin (Germany)	Computer Science	M.S., 2000
Humboldt University Berlin (Germany)	Computer Science	Ph.D., 2006

### Appointments

NYU Center for Data Science Research Engineer 11/2015-Data61, CSIRO (Australia) Team Leader 7/2012-11/2015 ICT Centre, CSIRO (Australia) **Research** Scientist 10/2010-6/2012School of Informatics, University of Edinburgh (U.K.) **Research Fellow** 11/2006-9/2010 Max-Planck-Institute for Molecular Genetics (Germany) Software Engineer 3/2006-10/2006 Kelman GmbH (Germany) Software Enginieer 6/2000 - 12/2000

## Products

#### Five most relevant products

- A Use Case in Semantic Modelling and Ranking for the Sensor Web. L. Cabral, M. Compton, H. Müller. International Semantic Web Conference (IWSC), 2014.

## Senior Personnel

PIs Kennedy is budgeted one month of summer salary and will apply his expertise and experience in the areas of databases, incremental computation, and probabilistic data curation. PI Kennedy will also take responsibility for (1) managing the project developer hosted by the University at Buffalo in their responsibilities as described below, (2) coordinating student-driven research efforts as described below, (3) coordinating his team's interactions with teams at other participating institutions, and (4) helping to drive the project's community-building efforts.

## **Other Personnel**

Funding is requested for one computer science graduate student assistant for three years. The two-semester and summer salary for the student is \$24,000, with a standard 2% raise per year (\$24,480 in Year 2 and \$24,970 in Year 3). The graduate student assistant will be expected to (1) participate in the conceptual development of Vizier, (2) drive the project's research efforts, in particular those pertaining to probabilistic data curation, (3) document their findings through workshop, conference, and journal papers, blog posts, and other media as appropriate.

Funding is also requested for one developer for three years. The full-year salary for the developer is \$100,000 with a standard 2% raise per year (\$102,000 in Year 2 and \$104,040 in Year 3). The developer will be responsible for the project's back-end implementation efforts; in particular focusing on aspects of Vizier related to the Mimir and GProM systems. For the first year, the developer will be tasked with bulletproofing, refining, and integrating both systems. In subsequent years, the developer's focus will remain on Vizier's compute and provenance management infrastructure.

## Fringe Benefits and Indirect Costs

Fringe benefit rates are based on the applicable federally negotiated rates published at http://www.research.buffalo.edu/sps/about/rates.cfm

## Equipment

N/A

## Travel

Travel may include trips to NSF meetings, conferences and workshops, and any PI meetings. Major conferences such as SIGMOD, VLDB, and ICDE, typically last 4-5 days, and are located both domestically and internationally. Workshops are often affiliated with major conferences, and attendees frequently attend both. We have budgeted for both the student and developer to attend one domestic conference, and for the student to attend one foreign conference. **Domestic Conferences** As an example of a domestic conference, we use SIGMOD 2016 being held in San Fransisco, CA. We anticipate a lodging cost of \$99 per night and a \$59 perdiem. The subtotal for 2 attendees over 5 nights is \$790. We expect airfare of \$630 and average conference registration fees of \$600 per person for a total domestic travel cost of about \$4000 per year.

**Foreign Conferences** As an example of a foreign conference, we use ICDE 2016 being held in Helsinki, Finland. We anticipate a lodging cost of \$200 per person, and a \$260 perdiem. The subtotal for 1 attendee over 5 nights is \$2,300 per person. We expect airfare of \$1000 and average conference registration fees of \$700 per person for a total international travel cost of \$4,000.

**Other Domestic Travel** We have budgeted an additional \$1000 per year for travel to NSF PI meetings, a yearly on-site meeting/workshop, and community outreach efforts.

## Other Direct Costs

## Computer Services

The negotiated rate with the Department of Computer Science and Engineering for computer services is \$156 per month of effort from faculty, students, and staff, or \$4212 for 12 months of student effort, 12 months of developer effort, and 1 month of faculty effort.

## Materials and Supplies

\$2,000 is requested in year 1 for Materials and Supplies to purchase desktop computers for the graduate research student, developer, and faculty working on this project. The computers will be used for code development, experimental evaluation, paper writing and typesetting and other efforts related to this project. An additional \$2,000 is requested in all years to pay for resources on a cloud compute platform such as Amazon's Web Services, Microsoft Azure, or similar. Cloud resources will be used for experimental validation, performance testing, enabling collaboration between group participants, and for hosting demonstration versions of Vizier.

## Other

Tuition is budgeted at the standard University at Buffalo rates for a senior Graduate Research Assistant at 9 credit hours per semester. The anticipated out-of-state student tuition for one student is \$19,782 in Year 1, increasing to \$21,564 in Year 2 and \$23,508 in Year 3.

## Indirect Costs

Indirect cost rates are based on the applicable federally negotiated rates published at http://www.research.buffalo.edu/sps/about/rates.cfm.

## **Budget Overview**

With the standard fringe rates, student tuition, and university overhead, the requested budget is \$1,054,615.

#### **Budget Justification**

#### Salary - Senior Personnel

We request 1.00 month summer salary for the PI for the duration of the project. The PI together will be responsible for managing the project as a whole and supervising all involved students.

#### Salary - Other Personnel

Two Ph.D. students will be supported for 3 years of the project working on discovery and repeatability components.

#### **Fringe Benefits**

Fringe benefit rate is 18.6% for academic year salary and 7.5% for the summer month salary. Rate for staff is 19.7%. Rate for students is 0%.

#### Equipment

None requested.

#### **Materials and Supplies**

We need to purchase devices so we can conduct experiments, for developing and debugging the system, and evaluate its scalability to ensure that it is efficient enough for the user communities that will use it. Typically we conduct experiments and debug on laptop or desktop machines. Additionally, some of the funds will be used to pay for cloud resources such as AWS to conduct experiments. We budget \$3000 for each year for such purchases and other miscellaneous office expenses for the PI's lab.

#### Travel

The PI requests travel support for him and his graduate students to attent top-level database conference and provenance workshops such as SIGMOD, VLDB, ICDE, EDBT, TaPP, and IPAW. These conference are held in both the USA and foreign countries. Participation in such forums is essential for disseminating the results and to keep informed of developments in the field. Additionally, these funds will also be used to attend meetings among the PIs and between the PIs and involved communities that will use Vizier.

Furthermore, traveling the PI expects to travel to NSF and to travel to give presentations to potential user communities in addition to the communities that have already committed to use the tool.

### **Other Direct Costs**

Tuition support for two Ph.D. students is requested at 9 credit hours per semester for all 3 years of the project with a total of \$25,200 in the first year, \$26,208 in the second year, and \$27,256 in the third year.

### Indirect Costs

The indirect cost rate is 53% for the entire duration of the project.

An inflationary rate of 1.04% is used for all categories for all years of the project.

## BUDGET JUSTIFICATION New York University Tandon School of Engineering Department of Computer Science & Engineering

## A. Senior Personnel:

PI: Juliana Freire, will serve as Principal Investigator on this research project and will devote 0.50 summer month during each year of the project. Dr. Freire will direct the project, having responsibility for the project outcomes.

Co-I: Heiko Mueller is an expert in data management, provenance and data cleaning. We are requesting 2.0 month of support per year for Dr. Mueller to perform the work outlined in the proposal.

Developer: We are requesting 12.0 month of support per year for a developer to perform the work outlined in the proposal.

Postdoc: We are requesting 6.0 month of support per year for a postdoc to perform the work outlined in the proposal.

## **B. Other Personnel:**

Graduate Research Assistant (GRA): We are requesting 12.0 months of support per year for a graduate student. The student will work on the tasks outlined in the proposal.

**C. Fringe Benefits:** The negotiated and approved fringe benefit rate for faculty & full time personnel is 29.5%. Salaries have been increased at a rate of 2.5% per year to reflect cost of living escalation for faculty, staff, and the GRA.

## D. Equipment:

## E. Travel:

- **Domestic:** \$10,000 is requested in each year of the project to allow the PI and/or other project personnel to travel for collaborative purposes and to attend conferences.
- Foreign: \$8,000 is requested in each year of the project to allow the PI and/or other project personnel to travel for collaborative purposes and to attend conferences.

## G. Other Direct Costs:

**1. Materials & Supplies:** \$10,000 is requested in year 1, and \$5,000 is requested in years 2 and 3 of the project for the purchase of necessary materials and supplies. In year 1, materials include laptops and/or desktops for the project members.

**Other**: Graduate Students receive tuition remission in lieu of fringe benefits. Tuition Remission is calculated at 51% of salary for each student supported on the project.

**I. Indirect Costs:** F&A is at 38.5% of MTDC, per NYU-Tandon's negotiated and approved rate agreement with ONR, dated 6/23/2014.

## University at Buffalo, SUNY

### Department of Computer Science and Engineering

General research facilities at UB's Department of Computer Science and Engineering include more than 200 i386 servers, x86\_64 servers, SPARC-servers, PCs, and thin-client workstations. The systems include three Dell Optiplexes, twenty-two Dell PowerEdges, two Dell Precision, one Sun 5220. one Sun Blade 1000, two Sun Fire 280R, two Sun Fire V20Zs, more than 100 Sun Ray thin client terminals, one Sun Ultra-60s, and a Dell PowerEdge based virtual machine infrastructure. These systems are attached to a NetApp FAS2050A installed with 13 TB of disk space. Nine Dell Optiplex systems are configured as Linux and Windows student workstations. Laser printing resources are readily available. Program-specific research facilities include over 50 dedicated research systems. The Computer-Assisted Diagnostics Interventions (CADI) Lab houses a 21-member compute cluster connected to a data storage device with 10 TB of installed capacity. The CyberInfrastructure (CI) Lab houses a 14-member Open Science Grid (OSG) compute cluster connected to a 15 TB (installed) data storage device. The Bioinformatics, Database, Data Mining, and Multimedia Group houses dedicated Oracle, MySQL, and compute servers. The Vision and Perceptual Machines Lab (VPML) include two Apple Xserves. Lab space and offices provided in Davis Hall houses workstations and specialized equipment for researchers. The departmental network-attached storage device provides 13 TB of installed disk space for general and specific research projects. The university provides office space for PI Kennedy and his students. PI Kennedy has improved these spaces using funding from his start-up package.

### The ODIn Lab @ UB

PI Kennedy's Online Data Interactions Lab at the University at Buffalo (http://odin.cse. buffalo.edu) maintains additional resources specifically for internal use, including multiple x86 workstations, laptops and low-power development boards (Raspberry Pis and Intel Galileos) for general lab member use, a 16-node Hadoop cluster shared with 3 other labs, a 4-node Raspberry Pi embedded database benchmarking micro-cluster, as well as three servers: (1) A 32-core AMD Opteron being used as an application server, hosting the lab's project management system, teaching support applications, and trial deployments of lab-developed software; (2) A 16-core Intel Xeon database server testbed, and (3) A 12-core Intel Xeon, 128GB RAM testbed server. Lab workstations and laptops are configured with OS X, Ubuntu Linux, or Windows. Servers are configured with Redhat Enterprise Linux.

## Illinois Institute of Technology

### DBGroup Lab

PI Glavic is the head of the database group (DBGroup) at IIT (http://www.cs.iit.edu/~dbgroup/). The university provides office space for PI Glavic and his students. PI Glavic has improved these office spaces using funding from his start-up package.

### Equipment

PI Glavic bought two servers from the funds provided through an unrestricted gift from the Oracle Corporation. Both machines have 2 x 3.3Ghz AMD Opteron CPUs, 128GB RAM, and 4 x 1TB hard drives configured as RAID 5. These machines are administered by the research data center at IIT. PI Glacic's laboratory has 5 desktop machines for student use.

### **Computer Science Department**

The computer science department provides several machines that are used in courses taught by PI Glavic which are related to this proposal including a course on data integration and provenance (http://www.cs.iit.edu/~cs520/). These machines are used to run DBMS instances (e.g., Oracle, Postgres) that are used by students to practice database operations (e.g., SQL, programmatic access to a database, run data cleaning operations).

### $\mathbf{IIT}$

IIT was listed on the National Register of Historic Places in 2005. The proposed research activities will not make any physical changes to IIT's campus and buildings.

# New York University

## Tandon School of Engineering

The Tandon School of Engineering (Tandon) at New York University is located in the Metrotech Center in Brooklyn, which is shared by a number of large modern buildings occupied by major corporations in the financial services industry and New York City agencies.

The School of Engineering has recently expanded its campus with 120,000 sq ft of newly leased space in 2 MetroTech Center and 15 MetroTech Center, which is part of both NYU's NYU 2031: NYU in NYC city-wide plan for academic space development and Tandon's capital plan, called the i2e (invention, innovation, and entrepreneurship) Campus Transformation, which is focused on attracting top-level faculty and high-achieving students and firmly establishing Tandon as a world-class center of applied science, technology and engineering.

The Computer Science and Engineering (CSE) department has 29 faculty members, and excellent computing facilities, including a number of teaching and research labs. CSE has just expanded into 2 MetroTech Center. The 10th floor space features faculty offices, computational labs, and workstations for post-docs and student researchers, among other facilities. The ninth floor has also been recently renovated to create large capacity classrooms and research space, including the Center for Advanced Technology in Telecommunications, and the Wireless Internet Center for Advanced Technology (WICAT) laboratory — the largest National Science Foundation-funded industry/academic cooperative research center.

VIDA: The Visualization and Data Analysis (VIDA) center is a relatively new addition to the School of Engineering. Silva is a faculty member in VIDA. VIDA is located on the 10th floor of 2 Metrotech Center and it houses students, staff, postdocs, and faculty in VIDA. The existing infrastructure in VIDA includes a number of dedicated servers, including machines that drive the birdvis.org, vistrails.org and crowdlabs.org domains. In order to enable collaborative large-scale software development, VIDA maintains machines that serve svn, git, trac, and wiki functionality. The group also has extensive visualization and data analysis facilities, including a high-resolution display wall, and a stereo video wall. Each graduate student, post-doctoral associate, software developer, and research scientists in the group has access to an individual high-end workstation.

Tandon has been awarded an equipment award, CNS-1229185, "MRI: Acquisition of an Infrastructure for Prototyping Next-Generation Algorithms for Large-Scale Visualization, Data Processing and Analysis" which includes a computing cluster and large disk storage that will be instrumental for this proposal. That proposed equipment is being installed at NYU's state-of-the-art machine room in a secure location in downtown Manhattan. The School of Engineering has excellent networking and power infrastructure, and it is connected to the Internet by high-speed links. This infrastructure will be instrumental in this project, allowing us to experiment with the new functionality to execute analyses and event detection using GPUs and in parallel and cloud-based infrastructure.

The Visualization and Data Analysis (VIDA) center has extensive computing infrastructure for this project. The existing infrastructure in VIDA includes a number of dedicated servers, including an enterprise level SAN system with 288TB storage capacity, 19 Hadoop nodes, each with 64 cores (AMD Opteron 2.3GHz), 256 GB of RAM and 12TB of disk and Infiniband interconnects, for a total of another 228 TB of disk. We also have specialized GPU nodes (12 cores 256GB RAM, 8 TB of disk and 3 GPUs (Geforce Titan, 6GB of VRAM each)).

As one of the 14 schools of New York University, Tandon has access to other substantial computational resources, including NYU's High Performance Computing Service.

Program URL: http://engineering.nyu.edu

### NYU Center for Urban Science and Progress

New York University's Center for Urban Science and Progress is a multi-sector, interdisciplinary research collaboration of partners from academia, industry, and U.S. national labs and the City of New York with the mission to make cities more productive, livable, equitable, and resilient. Our strategy and vision are data-driven and leverage advances in areas of computing such as optimization, modeling, simulation, prediction and inference; large-scale data management, visualization, and analytics; advanced sensing techniques; social computing; infrastructure design, control and management; and intelligent systems and decision-making.

Data Warehouse. CUSP's Data Warehouse is being developed as a significant resource for research and will both be leveraged to support this project and benefit from its outcomes. Envisioned as a user facility, the Data Warehouse provides: infrastructure for cataloging and storing data; a production environment that supports analysis of large urban data sets (e.g., cluster and cloud computing facilities, relational and NoSQL databases); and protocols and infrastructure for data access that ensure compliance with privacy and security constraints for individual datasets. A research and management group, including a data curator and privacy expert, support the facility and conduct related research in techniques methods and tools. Included in this effort is collaboration with CUSP researchers to: assist researchers in the design of data strategy to enable the reproducibility of results and data preservation after the completion of projects; and develop technology and solutions for processing urban data sets, such as cleaning and integration of disparate datasets, visualization, and analysis, including mining and application of machine learning techniques.

CUSP leverages a diverse range of existing, emerging, and new data flows, including data generated by and/or collected by the City of New York; sensor data, both from the City and from networks developed by CUSP for research; and novel data streams collected by CUSP researchers. The Data Warehouse currently houses 6TB of data, with an additional 400GB expected in the next few months. Data from the City of New York is acquired in part through a unique collaboration between CUSP and the City that underlies CUSP's mission. CUSP specifically collaborates with more than 15 City agencies and divisions, including: Department of Transportation, Department of Buildings, Department of Sanitation, Department of City Planning, Department of Health and Mental Hygiene, Department of Environmental Protection, Department of Information Technology and Telecommunications, Department of Parks and Recreation, City Police Department, City Fire Department.

Computing. CUSP's Brooklyn space houses a cluster with 20 HADOOP nodes, each with 24TB of disk, 256GB of RAM, and 64 AMD cores; 1 management node; 2 (high memory) server nodes, each with 1GB of RAM and 32 Intel cores; 2 (utility) serve nodes, each with 32GB of RAM and 8 Intel cores; 10GB Ethernet networking for the cluster; and an IBM General Parallel File System supported by a two server configuration and approximately 1PB raw storage. Cloud computing resources are provided by CUSP's industry partners.

Office. CUSP currently occupies a 27,000 square foot full floor of 1 MetroTech Center located in Downtown Brooklyn, adjacent to NYU Polytechnic School of Engineering, with classroom space next door in NYU's Media and Games Network (MAGNET) at 2 MetroTech Center. As of fall 2014, our faculty, students, and staff will also have access to an additional 30,000 square feet of space in a neighboring building before moving into a total of 150,000 square feet of space in 370 Jay Street, Brooklyn (projected move-in, 2017 based on completion of renovation).

Program URL: http://cusp.nyu.edu

- 1. Types of data and other materials produced during the course of the project. There are several main types of materials that the investigators will produce during the course of this project:
  - (a) A public binary and source-code release of the Vizier data curation tool, including user and developer documentation;
  - (b) A library of example curation notebooks and datasets;
  - (c) minutes and proceedings of the proposed workshop;
  - (d) scientific papers describing the tools and datasets generated;
  - (e) educational materials, including lecture notes, problem sets, and demonstrations.

# 2. Standards to be used for data format and content.

The standard format the dissemination of research results for the computer science community is to provide access to the research papers in a Portable Document Format (i.e., .pdf) in several online repositories such as the IEEE and Association for Computing Machinery (http://ieeexplore.ieee.org/Xplore and http://dl.acm.org/) digital libraries. It is also standard practice to post preprint copies on a personal webpage (depending on the copyright restrictions of peer-reviewed journals) and through open-access repositories such as www.arXiv.org. Source code is also stored on personal webpages or at public repositories such as www.github.com. The proposed budget includes an allocation for a demonstration deployment of the proposed system on a cloud-hosting platform such as Amazon EC2 (http://aws.amazon.com).

Where practical, example data will be stored in standard formats such as CSV and JSON. Example curation notebooks will be made available in a self-documenting format like JSON, YAML or Markdown. Documentation will be stored in plaintext, HTML, Markdown, and/or PDF.

Educational materials are stored in a variety of formats from PDF files of lecture notes and problem sets, to PowerPoint, HTML, or PDF slides will be posted on the personal webpages of the course instructors. Interactive course materials built on top of Vizier will be made publicly accessible through the demonstration deployment.

System implementations, log parsers, and other programs produced as part of this project will be in standard programming languages such as Scala, Java, JavaScript, Ruby, Python, and/or C.

# 3. Methods and policies for providing access and enabling sharing.

All public data will be stored either in publicly accessible databases or websites hosted by one or more participating departments, or made accessible via the demonstration deployment of Vizier.

# 4. Provisions for re-use, re-distribution, and the production of derivatives.

We will use Creative Commons licenses http://creativecommons.org/licenses/ for the re-use, re-distribution, and the production of derivatives of the project data, while respecting the limitations on copyrighted material from published journals. We will use Apache

licenses http://www.apache.org/licenses/ or similarly permissive licenses for the re-use, re-distribution, and the production of derivatives of all project source code, while respecting the licenses of any library dependencies.

### 5. Methods for archiving and preserving access to data and materials.

All data and materials will be stored on back up systems indefinitely.

The investigators will mainly rely upon the facilities of their respective participating departments to maintain web access to the course materials, sources codes, and papers.

## Mentoring Plan for Postdoctoral Researcher

NYU is committed to advancing and developing the careers of young researchers. In addition to engaging postdoctoral fellow(s) in active research, we will employ the following mentoring plan.

**Orientation** will include in-depth conversations between the supervisor (Freire) and the Postdoctoral Researcher (PR). Mutual expectations will be discussed and agreed upon in advance. Orientation topics will include (a) the amount of independence a PR requires, (b) interaction with coworkers, (c) productivity including the importance of scientific publications, and (d) documentation of research methodologies and experimental details so that the work can be continued by other researchers in the future.

**Career Counseling** will be directed at providing the Postdoctoral Researcher with the skills, knowledge, and experience needed to excel in his/her chosen career path. In addition to guidance provided by the respective supervisors, the PR will be encouraged to discuss career options with researchers and supervisors at the NYU Tandon and at CUSP.

**Experience with Preparation of Grant Proposals** will be gained by direct involvement of the PR in proposals prepared by the supervisors. The PR will have opportunities to learn best practices in proposal preparation including identification of key research questions, definition of objectives, description of approach and rationale, and construction of a work plan, timeline, and budget.

**Publications and Presentations** are expected to result from the work supported by the grant. These will be prepared under the direction of the respective supervisors and in collaboration with other researchers participating in this project at the other institutions, as appropriate. The PR will receive guidance and training in the preparation of manuscripts for scientific journals and presentations at conferences.

**Teaching and Mentoring Skills** will be developed in the context of regular project meetings, during which graduate students and postdoctoral researchers will describe their work to colleagues within the group and assist each other with solutions to challenging research problems, often resulting in cross fertilization of ideas. The PR will be encouraged to develop independent projects with graduate students.

**Instruction in Professional Practices** will be provided on a regular basis in the context of the research work and will include fundamentals of the scientific method and other standards of professional practice. In addition, the PR will be encouraged to affiliate with one or more professional societies in his/her chosen field.

**Technology Transfer activities** will include training on the patent process, and will include regular patent search activities. The collaborative team will be pro-active in the process of identifying contributions of commercial value, and will teach the PR how to protect the generated intellectual property. The PR will be given an opportunity to become familiar with the university-industry relationship including applicable confidentiality requirements and preparation of invention disclosure applications.

**University Programs** NYU's Office of Postdoctoral Affairs (OPA) aims to provide a community for NYU postdocs. The OPA also offers Workshops for Emerging Scientists, addressing topics such as research misconduct, conflict of interest, mentor/trainee responsibilities, collaboration in science, publication practices and responsible authorship, ethical considerations in research with human and animal subjects, ownership, acquisition, storage and sharing of research data, and survival skills for a career in research. These workshops are augmented with ongoing programs provided through the Science Alliance Program of the New York Academy of Sciences, a consortium of universities and research institutions committed to advancing the next generation of scientists. Along with a wide range of career mentoring activities, the Science Alliance also offers conferences, workshops, discussion groups, eBriefings, and encounters with industry representatives and other potential employers.

**Success of the Mentoring Plan** will be assessed by monitoring the personal progress of the PR through tracking of the PR's progress toward his/her career goals after finishing the postdoctoral program.

1 MetroTech Center, 19FL Brooklyn, New York 11201 tel: 646.997.0500 fax: 646.997.0560 web: cusp.nyu.edu

April 1, 2016

Dear Juliana,

動發

I strongly support your NSF proposal entitled "CIF21 DIBBs: PD: Collaborative: Streamlining and Understanding Curation with Vizier" and I look forward to collaborating with you in this endeavor.

As you know, we manage the Data Facility at the NYU Center for Urban Science and Progress (CUSP). CUSP leverages a diverse range of existing, emerging, and new data flows, including data generated by and/or collected by the City of New York; sensor data, both from the City and from networks developed by CUSP for research; and novel data streams collected by CUSP researchers. The Data Facility has been established to support the empirical study of cities in conjunction with New York based researchers, agencies, and citizens. The CUSP Data Catalog is online at datahub.cusp.nyu.edu/catalog and currently hosts over 65TB of data.

Data from the City of New York is acquired in part through a unique collaboration between CUSP and the City that underlies CUSP's mission. CUSP specifically collaborates with more than 15 City agencies and divisions, including: Department of Transportation, Department of Buildings, Department of Sanitation, Department of Citywide Administrative Services, Department of Design and Construction, Department of City Planning, Department of Health and Mental Hygiene, Department of Environmental Protection, Department of Information Technology and Telecommunications, Department of Parks and Recreation, City Police Department, City Fire Department. Under this agreement, CUSP works with City agencies to: (1) identify significant real world problems affecting the delivery of municipal services and critical challenges to the urban environment and economy, and (2) develop and implement research approaches to these problems and challenges. The goal is to understand and improve urban systems, the urban quality of life and city planning.

In addition to data from the City of New York, CUSP is working with the City and other community and industry partners to develop and deploy sensor networks and other novel data generation practices for research to support our mission to make cities more productive, livable, equitable, and resilient.

Data quality is crucial for the CUSP Data Facility (CDF) and it is also a major challenge. As one of the original designers of the CDF, you are aware that given the large number

63

1 MetroTech Center, 19FL Brooklyn, New York 11201 tel: 646.997.0500 fax: 646.997.0560 web: cusp.nyu.edu

of heterogeneous data sets we store, and the broad range of projects that use subsets of these data, it is not possible for us to adopt the traditional warehouse approach -extract data, transform, and load (ETL). As you describe in your proposal, even for a given data set, different projects (and research questions) require different curation pipelines, thus there is no one-size-fits-all solution we can adopt. This problem is compounded due to the fact that many of the CDF users have little or no programming expertise.

We have a clear need for a tool such as the one you propose. Besides streamlining the curation process and enabling domain experts to curate the data they need as they explore the data, we see a great opportunity for such a tool to enable collaboration and re-use. A shared repository of curation pipelines will enable our users to benefit from the collective wisdom: they will be able to search for pipelines, re-use them, and learn by example how to build new pipelines. Another key feature that your tool provides is detailed provenance capture for both the data and the curation process. The various projects using the CDF produce a large volume of derived data that are also stored in the facility. To re-use and properly analyze these derived data, users need their provenance to understand the curation process applied to the data, and to assess whether that is compatible with their analysis needs. Besides, since much of the data we keep come from feeds that change over time, we need to also carefully track which curation pipelines were applied to which feeds.

The Urban Data Profiler system you designed and developed has already been deployed at the CDF. The system has been successfully used to derive metadata for many of our data feeds, as well as to identify data quality issues. We see the work you propose on Vizier a natural next step. We look forward to working with you on this project and we hope to deploy the system in the CUSP Data Facility.

Re: DIBBs Solicitation, NSF 16-530

The New York City Taxi and Limousine Commission (TLC), created in 1971, is the agency responsible for licensing and regulating New York City's transportation for hire industries, including yellow and green taxicabs, liveries and black cars. With around 90,000 licensed vehicles, we are continually gathering and analyzing data to improve transit service for all New Yorkers. As part of our commitment to become a data-informed city agency, we undertook an initiative in 2015 to publish trip records collected from licensees or about licensee operations online. As a result, academics, researchers, and the public are now able to study our data and gain insight into our city's movements. We welcome these activities, as they provide another means of determining whether our regulated industries are as efficient and accessible as possible and provide service where and to whom it is needed. We understand, and plan to continue to use, the transformational potential of data-driven policymaking, and plan on publicizing more data as time goes on.

New York University has approached TLC with an opportunity to collaborate on the Vizier system NYU is currently building, with the grant opportunity offered through NSF 16-530. We see great potential in the Vizier system as a form of data exploration. This framework streamlines the data curation process by distinguishing between outlying data features worthy of analysis versus data errors that are missing or require cleaning. This system could greatly improve the TLC's ability to analyze data that we provide publically, and as such aligns with our mission to provide more and better data.

Our data is extremely important to the work that we do, and we support this proposal for collaboration. We look forward to collaborating with NYU in several ways: 1) offering a variety of data for all yellow and green taxis and for-hire vehicles; 2) providing feedback on the techniques developed to automate the data cleaning process; and 3) testing the system that will be built.

Please feel free to contact us with any questions regarding our planned support of this project.

Sincerely,

Lodney

Rodney Stiles Executive Director of Policy and Analytics

Architect Oracle Corporation Oracle ST 500 Oracle Parkway Redwood City, CA 94065

Dear NSF Panel:

In my role as Architect at Oracle, I wish to express my wish to collaborate with the PIs on the proposal entitled *CIF21 DIBBs: PD: Streamlining and Understanding Curation with Vizier*. Maintaining high quality data is an important issue for Oracle, as many of Oracle's clients must regularly manage unstructured, incomplete, or otherwise uncertain data. Current data curation products do not expose uncertainty information to the user and do not support the exploratory, incremental construction of a data curation workflow. Once curated data is digested into a database, it is typically hard to determine whether this data is trustworthy, because of lack of provenance information about the curation steps that were applied to the data. Our clients need a platform that tracks provenance, exposes uncertainty, and provides full accountability given the frequent changes applied to a curation workflow under development. Ideally, such a platform should guide a user through the steps of creating a curation pipeline, providing recommendations along the way on what curation steps to apply and how to tune them.

The proposed research is novel, because it is the first solution that 1) supports incremental development of data curation workflows with full explainability (using provenance to explain the existence of every piece of data, where is coming from, how it got transformed and why, and any uncertainty associated with it); 2) leverages past curation efforts through recommendations based on provenance; and 3) naturally supports the exploratory nature of curation through versioning of workflows and unlimited undo of operations. Vizier is transformative, because by involving several communities with dire curation needs, the project will have significant impact on real world curation practice. Oracle is interested in integrating the library of data curation steps developed as part of Vizier and its provenance tracking and recommendation facilities into our own data curation products.

I have been collaborating with the PIs Kennedy and Glavic on the Mimir and GProM projects respectively. Note that these projects are two out of the three major building blocks of the Vizier system that will be build in this proposal. Oracle has been supporting both PIs' research efforts for the past years through unrestricted gifts totaling roughly \$500,000. I have been in contact with PI Freire for several years and am well aware of her seminal work on VisTrails, the third major component of the proposed system.

If the proposal is selected for funding by the NSF, it is my intent to collaborate and commit resources as detailed in the Project Description and described in the following. Any resource allocation has of course to go through Oracle's approval process as was the case for the current collaborations. I expect to spend time to advice the PIs by participating in the regular meetings that are part of the projects collaboration plan. My decade-long experience in working on the technical and research aspects of implementing database systems makes me an ideal candidate to advise on architectural, conceptual, and implementation issues. Furthermore, I can provide advice on experimental evaluations of Vizier that use our products. Last but not least, as a veteran in the database industry I have a thorough understanding of our customer's needs and am very well connected. I plan to leverage my connections and understanding to broaden the user base of the project.

If you have any questions, please contact me at dieter.gawlick@oracle.com or (650) 506 8706.

Yours sincerely,

Q. fer l. l.

Dieter Gawlick, Architect at Oracle

April 1, 2016

Dear Juliana,

I am writing to support your NSF DIBBs proposal entitled " Streamlining and Understanding Curation with Vizier" and to confirm my interest in collaborating with you on this project.

I am a Professor at the NYU Wagner School and the Faculty Director of the NYU Furman Center, a research center devoted to the study of housing, land use, and neighborhoods. We are committed to producing research that influences urban policy. Some of the Furman Center's early work provided some of the first hard evidence of the benefits that subsidized housing investments can provide to communities. More recently, our analysis of the data on the subprime debacle and the foreclosure crisis has helped quantify the costs of the crisis to children, neighbors, and communities. Our assessment of crime data and property-level foreclosure data led to the finding that properties on the way to foreclosure (rather than those that have already been foreclosed) invite crime.

As you know, a common theme in our projects is the need to analyze multiple data sets. Over the years, at the Furman Center we have accumulated a broad array of data on demographics, neighborhood conditions, infrastructure, housing stock and other aspects of New York City's neighborhoods and real estate market. Due to the nature of our work, and the potential impact it has on policy making, data quality is crucial for us. Moreover, we make much of these data available online as part of the Furman Center Data Services (http://furmancenter.org/data), and every year, we publish a report on the "State of New York City's Housing & Neighborhoods", a compendium of data and analysis about New York City's housing, land use, demographics, and quality of life indicators for each borough and the city's 59 community districts.

For each analysis we perform, a lot of effort is devoted to curating the data sets we use. As you articulate in your proposal, often, it is during these analyses that we discover serious data quality issues. Currently, we perform data cleaning in an ad-hoc fashion for each project we carry out. Besides being a time-consuming process, we face several challenges regarding (1) re-use---as we obtain new data sets or data feeds, it is hard to assemble new cleaning pipelines; (2) lack of systematic provenance capture---as we iteratively clean our data, it is hard to precisely document the cleaning steps applied to the data and to keep track of the different versions that are derived. As a result, curation is a major bottleneck in our research.

The tool you propose to develop has great potential for practical impact in the work we do. By combining data curation and exploration, and capturing detailed provenance, it addresses many

of the challenges we have to deal with on a daily basis. I welcome the opportunity to contribute to the design of the tool and I hope to deploy it at the Furman Center.

I look forward to continuing to collaborate with you and your group.

Sincerely,

olynd H Ell

Ronny Fehling Vice President, Head of Data Driven Technologies and Advanced Analytics *Airbus Group* 

Dear NSF Panel:

In my role as Vice President, Head of Data Driven Technologies and Advanced Analytics at Airbus, I wish to express my wish to collaborate with the PIs on the proposal entitled *CIF21 DIBBs: EI: Vizier, Streamlined Data Curation*. Airbus has an ongoing need to analyze large, noisy heterogeneous data. Sensors deployed on aircraft, satellites, or in test environments, simulation results, GPS data, manufacturing, repair logs, and other records are regularly analyzed to develop platforms that are safer, cheaper, cleaner, and more efficient. I am presently coordinating several data integration and data curation efforts at Airbus, including an effort to build a company-wide data lake. There are several key challenges in this effort: (1) Enabling efficient discovery of datasets relevant to an analyst's goals, (2) Integrating datasets from different sectors of Airbus that may have different schemas, data domains, or underlying assumptions, (3) Ensuring that proprietary and sensitive data remains secure, even through data derivatives, (4) Harvesting data and lineage information from opaque, static APIs, (5) Operating over a heterogeneous environment of Hadoop, client APIs, many databases, external tables, and dynamic data sources, (6) Helping analysts quickly visualize and contextualize datasets.

I have been collaborating with PI Kennedy on the Mimir project, one of the three major building blocks of the Vizier system, and believe that Vizier is well positioned to help us to address many of these challenges. If the proposal is selected for funding by the NSF, it is my intent to collaborate and commit resources as detailed in the Project Description and described in the following: (1) I expect to spend time to advise the PIs by participating in the regular meetings that are part of the project's collaboration plan, (2) I will provide the PIs with examples of datasets that exemplify data quality challenges faced by Airbus, (3) I will facilitate discussions between the PIs and prospective users at Airbus for the purpose of providing feedback about Vizier prototypes and the project's goals, (4) Once the project reaches a mature state, I will help to facilitate a preliminary deployment.

If you have any questions, please contact me at ronny.fehling@airbus.com.

Yours sincerely,

Ronny Fehling

Zhen Hua Liu Architect Oracle Corporation Oracle ST 500 Oracle Parkway Redwood City, CA 94065

Dear NSF Panel:
